Development of fast controls for Beam Wire Scanner at SuperKEKB

Anindya Roy

Variable Energy Cyclotron Centre
Dept. of Atomic Energy, India
What is Wire-scanner?

- Used for Non-destructive monitoring of beam profile
- A frame holding 100µm Tungsten wire forming X, Y & U wires perpendicular to beam
- A stepper motor drive to move the frame inside beam line
- A PMT with Plastic Scintillator to detect Bremsstrahlung emitted due to interaction of wire with Beam
- A control & data acquisition system
- A set of three (atleast) wire-scanner for measuring beam emittance & Twiss parameter for optics matching

6/14/2012
Fast Controls for Beam Wire Scanner
Existing system

- VME/CAMAC system
- EPICS Base-3.13 and Vx-Works 5.3
- PowerCore 6750 CPU card
- 12 ch Lecroy CAMAC ADC
- VME GPIB controller to communicate with Pulse motor controller & Digital Multimeter
- ADC Gate signal generated from Beam timing signal, no information about beam mode
- Beam mode identification using dedicated ADC channel for each beam mode
- IOC independent process for acquiring Beam data and wire position signal and saving in buffer
- Uniform wire speed while scanning the beam
- Not suitable for acquiring multiple beam mode data
Existing system (hardware architecture)

- **VME SYSTEM (EPICS IOC)**
  - CPU
  - CAMAC SERIAL INTERFACE
  - VME CAMAC INTERFACE

- **CAMAC SYSTEM**
  - GATE GENERATOR
  - Pulse

- **DIGITAL MULTIMETER**
- **PULSE MOTOR CONTROLLER**
- **STEPPER MOTOR DRIVER**
- **PULSE MOTORS**
- **PMT**
- **BEAM WIRE-SCANNER SYSTEM**

- Control & data interface
- VME interrupt on ADC LAM
- Control signal
- Pulse feedback
- Power output
- PMT output
- High voltage

- Position (Voltage) Feedback
- Control signal

6/14/2012
Fast Controls for Beam Wire Scanner
Existing system (software architecture)

USER INTERFACE (SAD)

EPICS (3.13) IOC
- It control the process and acquire data from all signal sources
- It reads the whole event queue at a time and store the data as a special wave form record
- It sends the data to user interface using CA protocol

CAMAC DAQ THREAD
- It runs as an independent application
- It creates event queue memory using user specified configuration
- It writes scaler, BPM and WS ADC data, on LAM interrupt of ADC, as one event into the event queue

EVENT RING BUFFER (GLOBAL MEMORY)
- EVENT - 0
- EVENT - 1
- ..... EVENT - N

EVENT - x
- n X SCALER
- m X BPM
- p X WS
Why is the new controls for Wire-scanner?

- 8 Gev LINAC, simultaneously, injects of $e^-$ and $e^+$ beam of different characteristics into
  - KEKB high-energy ring (HER) – 8.0 GeV, 2nC
  - KEKB low-energy ring (LER) – 3.5 GeV, 2nC
  - Photon Factory (PF) – 2.5 GeV, 0.1nC
  - PF/AR – 3.0 GeV, 0.1nC
- The operation of all equipments along BT are synchronized by LINAC Timing system for simultaneous injection
- A wire-scanner data acquisition system, synchronized with Timing system, can measure beam profiles of multiple beam modes simultaneously in a single run
- Identification of beam modes can be done using timing information available from timing system
- Simultaneous measurement reduces measurement time and hence improves the overall efficiency of the transport line
- May help in PF and PF/AR beam studies without degradation of luminosity at KEKB!
LINAC Timing system

- MRF’s series-230 Event Generator/Receiver
- 114.24 MHz event rate
- Multi/Single mode fiber connectivity
- Timing precision < 10ps
- 20msec Beam switching
- Control approx. 1000 devices in LINAC
- Every pulse (20msec) corresponds a beam mode
- 10 different defined beam modes
- One beam pulse contains several event codes
  - Atleast one Main event code and a preparation code
  - 50 defined event codes
- Main event code and preparation event code are in sequence
  - Main event triggers timing signal
  - Preparation event trigger software to exchange analog & delay parameters
- Total number of receiver: 17 (+ 1)

Reference:
"Timing system towards SuperKEKB controls " – Kazuo Furukawa, EPICS Collaboration Meeting, NSRRC, June 2011
New system

- Emerson MVME5500 CPU card, EPICS Base-3.14.12.1 and Vx-works 6.8 combination
- VME based ADC (14bit, 15μsec conversion time), Scaler and DAC hardware.
- MRF’s event receiver module (VME-EVR-230RF) - synchronizing the data acquisition process with LINAC timing system
- A LAN/GPIB converter to communicate with Pulse motor controller (PMC) and Digital Multimeter (DMM) for control and data acquisition.
- ADC Gate generated by event receiver – less complicated hardware setup
- Multispeed wire movement to minimize time of scan and maximize useful data
- Options to user for selecting beam modes for data acquisition
- Application specific EPICS record to retain data format for SAD user interface
- Installed at Sector 5 of LINAC BT

BEAM WIRE-SCANNER SYSTEM

Events
Event Receiver

- **Basic feature**
  - Manufacturer – Micro Research Finland, Model - VME-EVR-230RF
  - Bit rate 1.0 to 2.5 Gbps, event clock rate 50 MHz to 125 MHz
  - Four programmable front panel TTL outputs
  - Two front panel TTL inputs
  - Three differential CML pattern outputs capable of RF recovery
  - Two universal I/O slots
  - Rear I/O
  - Jitter typically < 15 ps rms for TTL outputs, < 5 ps rms for CML outputs
  - Support VME64x CR/CSR addressing mode

- **EPICS device support**
  - Already available at EPICS Hardware support inventory (mrfioc2-2.0.0.tar.gz) (http://sourceforge.net/projects/epics/files/mrfioc2/)
  - As current EPICS version does not support CR/CSR addressing mode in OS independent manner, hence devLib2 module (devlib2-2.2.tar.gz) (http://sourceforge.net/projects/epics/files/devlib2/)
  - EPICS MSI tool to build the above modules (msi1-5.tar.gz) (http://www.aps.anl.gov/epics/extensions/msi/index.php)
Event Receiver (configuration)

- EPICS device driver configuration (Different experience from usual VME device configuration!)
  - Setting up module (IOC initialisation)
    - mrmEvrSetupVME(NAME, SlotNo, MapAddr, IntrLevel, IntrVectorAddr)
      - **NOT Identified by SLOT No, but by NAME** - different from usual EPICS VME device support style!
  - Each feature (register) is accessed by “Module name:Feature name” (OBJ) and property name (PROP) fields
    - e.g. field(OUT, "@OBJ=EVR1:Pul0, PROP=Delay") => writing into register
    - field(INP, "@OBJ=EVR1:Pul0, PROP=Delay") => reading from register
    - Little difficult to trace NAME of each register, hence better to copy and modify sample records!!
  - Four record types – ai, ao, longout & longin
  - Four device types (DTYP)
    - “Obj Prop uint32” – for longin & longout records
    - “Obj Prop double” – for ai & ao records
    - “EVR Pulser Mapping” – for mapping Event codes to pulse generator (longout record)
    - “EVR Event” – for mapping Event codes to EPICS Event (longout record)

- Important properties to configure
  - Enabling the module - `field(OUT, "@OBJ=EVR1, PROP=Enable")`
  - Setting up Clock - `field(OUT, "@OBJ=EVR1, PROP=Clock")`
  - Setting up Time stamp source - `field(OUT, "@OBJ=EVR1, PROP=Timestamp Clock")`
  - Mapping front panel output to pulse generator - `field(OUT, "@OBJ=EVR1:FrontOut0, PROP=Map")`
  - Enabling & Configuring pulse generator (i.e. delay, width, polarity) - `field(OUT, "@OBJ=EVR1:Pul0, PROP=Polarity")`
  - Mapping timing event to pulse generator - `field(OUT, "@OBJ=EVR1:Pul0, Func=$(F=Trig)")`
  - Mapping timing event to EPICS Event - `field(OUT, "@OBJ=EVR1,Code=31")`
Event Receiver (tuning)

- Synchronization of reference clock with incoming events from event generator
- Clock Reference generated internally
  - Micrel SY87739L Protocol Transparent Fractional-N synthesizer, reference clock of 24 MHz
- LINAC event rate is 114.24 MHz
- Relation between event rate & reference clock for Micrel SY87739L is

\[
\text{Event rate (MHz)} = \left\lfloor \frac{(M/N) \times \left\{P - \left(\frac{Q_{(p-1)}}{Q_p + Q_{(p-1)}}\right)\right\} \times \text{Fref}}{\text{PostDivSel}} \right\rfloor
\]

where

- \(\text{Fref} = 24.0\ \text{MHz}\)
- \(\text{PostDivSel} = 6\)
- \(M = 14,\ N = 14,\ \text{therefore } M/N = 1\)
- \(P = \text{Mod}\left(\text{Event rate} \times \text{postDivSel}/\text{Fref}\right) = 29\)
- \(Q_{(p-1)} = 14\)
- \(Q_p = 32 - Q_{(p-1)} = 18,\ \text{as } Q_p + Q_{(p-1)} = 32\)

the bit pattern of configuration word

0000-Q_p(5)-Q_{(p-1)}(5)-P(4)-000-\text{PostDivSel}(5)-N(3)-M(3)

Hence the configuration word for 114.24 MHz is

093B01AD (0000-10010-01110-1100-000-00110-101-101)

- The configuration word to be stored in EVR non-volatile memory 10baseT network interface
Data acquisition strategy

• **Requirement:** configuration of pulse generator (i.e. delay & timing event) for each beam mode to generate ADC Gate synchronized with beam pulse

• **Solution:** Utilize two consecutive timing events for pulse generator configuration and data acquition

---

**Event sequence**

- EVENT-n
- DlyGen0: Delay-SP
- SCAN: Passive
- KEKB: Pul0: Evt
- SCAN: Passive
- @OBJ=EVR1: Pul0, PROP=Delay

**Event preparation**

- Gate-Delay
- SCAN: Event
- NPP NMS
- DOL
- SI NIK
- SDIS
- ao
- FLNK
- VAL
- OUT
- SDIS
- SI NIK
- DOL

- Gate-Pulse
- SCAN: Event
- NPP NMS
- DOL
- SI NIK
- SDIS
- ao
- FLNK
- VAL
- OUT
- SDIS
- SI NIK
- DOL

**Setting Gate delay**

- @OBJ=EVR1: Pul0, PROP=Delay

**Setting Event code [EVENT-(n+1)] for generating gate pulse**

- @OBJ=EVR1: Pul0, Func=$(F=Trig)

**Generate Gate pulse**

- EVENT-(n+1)
- Dbl pulse 1st, KLY HV

**Wire-scanner Record**

- DELAY
- Read ADC & SCLR

Fast Controls for Beam Wire Scanner
Wire-scanner (WS) Record

- **Why a new record?**
  To keep the interface (software) to Wire-scanner User interface (SAD panel) UNCHANGED,
  To minimize impact on OTHER proven PROCESSES

- **Features**
  - Application specific – suit the purpose of wire scanner system
  - A waveform record with multiple input links (26, INPA….INPZ) for collecting data
  - A Ring Buffer, appending an array of data (from input links) on every scan
  - Provision for delay the processing – to ensure completion of ADC conversion (if LAM is absent!)
  - Fields for defining number of SCALER, BPM (4 ADC per BPM) and wire-scanner ADC channel
  - Field for appending BEAM mode (event code) to data on every scan for identification
  - Option for resetting the buffer
  - Option for calibrating BPM signal using calibration data (Not yet tested!)
  - Field for defining calibration data file path

- **Constraint**
  SCALER, BPM and ADC data sources (pv links) should be defined in sequence at the input links (i.e. from INPA…..) according to the respective numbers
Wire-scanner movement

- Driven by Pulse motor (4µm/pulse) – maximum distance of 100mm
- Controlled by 4 channel Pulse Motor Controller with GPIB interface and
  - Provisions for Mechanical and Logical Limit to restrict over drive
  - Pulse feedback while moving forward direction only
  - Options for HIGH / MEDIUM / LOW speed movement
  - Options for Relative / Absolute movement

- Why Multi-speed scan?
  - X, Y & U wire interact with beam at three distinct regions of whole span
  - Slow speed scanning at regions of interactions results into better beam profile
  - Higher speed (Fast) at other regions results into optimum scan time

- Implementation
  - Divide span of movement into seven regions (as shown in Fig)
  - Slow speed regions are defined by peak position and width around the peak
  - Defining HIGH & LOW speed values
  - Absolute scan, to restrict over drive
Wire-scanner movement (Flow-chart)

START (AUTO_SCAN=1)

SET REMOTE MODE (REM:CMD=1)

SET LOW SPEED (LSPD_WT=7, 200pps)

SET MED SPEED (LSPD_WT=21, 1000pps)

Fast Controls for Beam Wire Scanner
User interface (MEDM)

- To control and monitor the data acquisition process, built using MEDM
- Provisions provided for
  - Defining peak positions and corresponding width around them
  - Specifying HIGH / MEDIUM / LOW speed index
  - Specifying EVR output, Pulse delay, pulse width, polarity etc. for particular BEAM mode
  - Selecting BEAM modes
Test Results

As obtained, seems to be satisfactory!
Sincere Regards to:
Kazuro Furukawa
Tatsuro Nakamura
Naoko Iida

Special Thanks to:
Tomohiro Okazaki
Shiro Kusano
Thank you!
