

The ATLAS Experiment Getting Ready for LHC

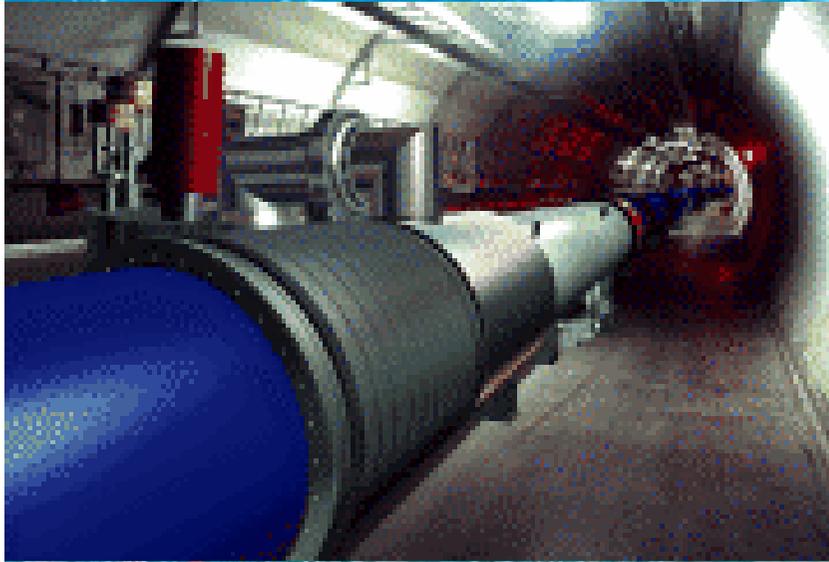

Exploring the High-Energy Frontier of Particle Physics

*University of Tsukuba and KEK, May 18th, 2005
(P. Jenni, CERN)*

The Large Hadron Collider is a 27 km long collider ring housed in a tunnel about 100 m below the ground near Geneva

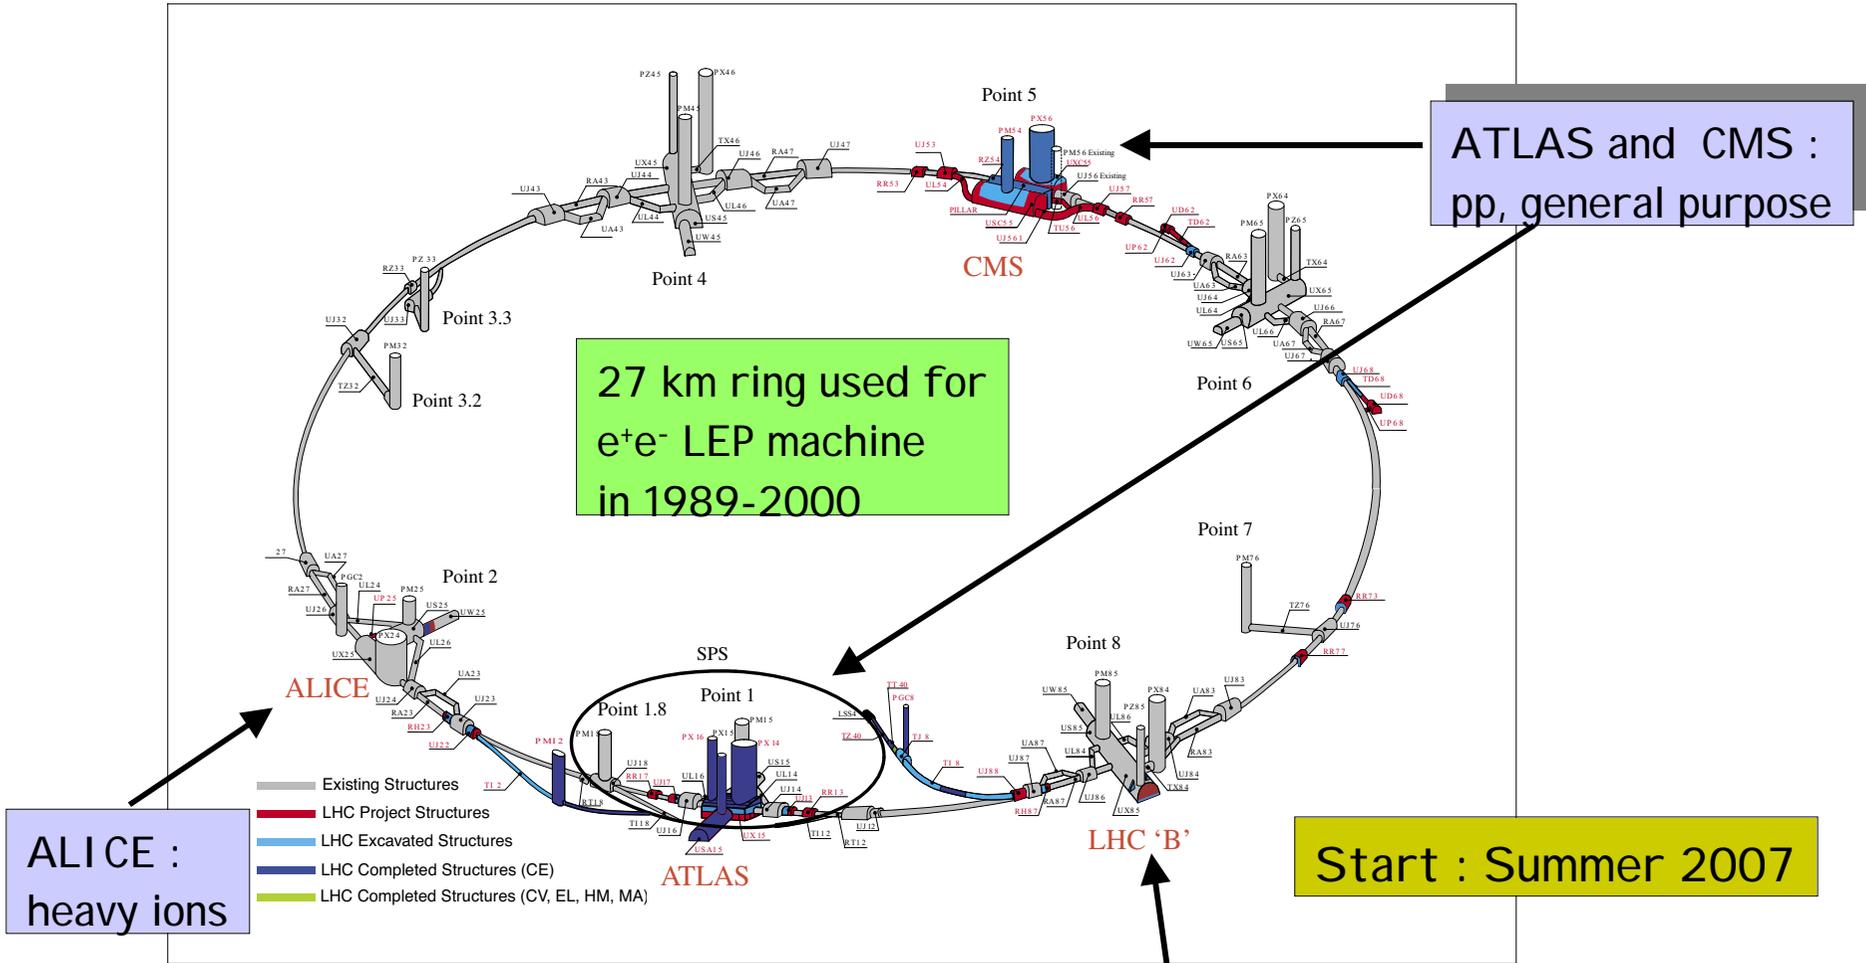

LHC

pp

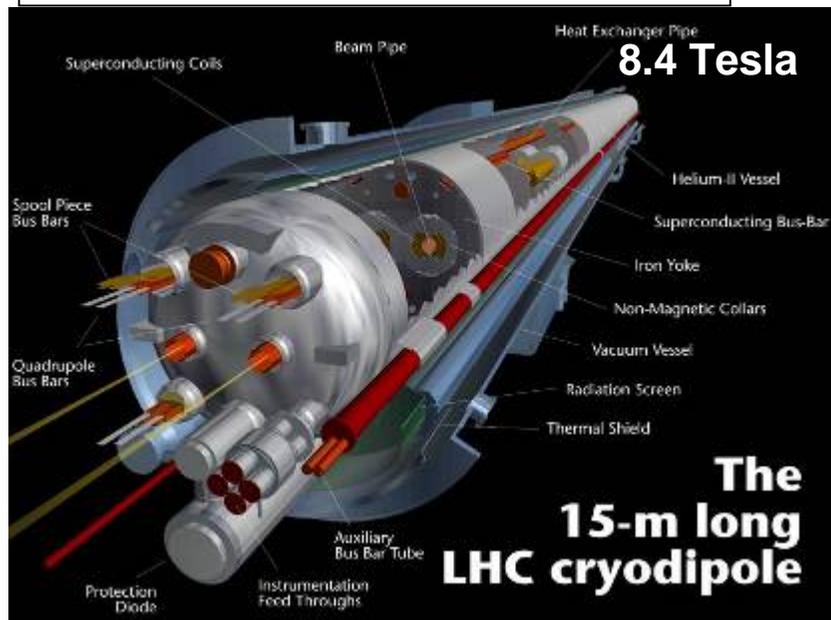

- $\sqrt{s} = 14 \text{ TeV}$ (7 times higher than Tevatron/Fermilab)
 → search for new massive particles up to $m \sim 5 \text{ TeV}$
- $L_{\text{design}} = 10^{34} \text{ cm}^{-2} \text{ s}^{-1}$ (>10² higher than Tevatron/Fermilab)
 → search for rare processes with small σ ($N = L\sigma$)

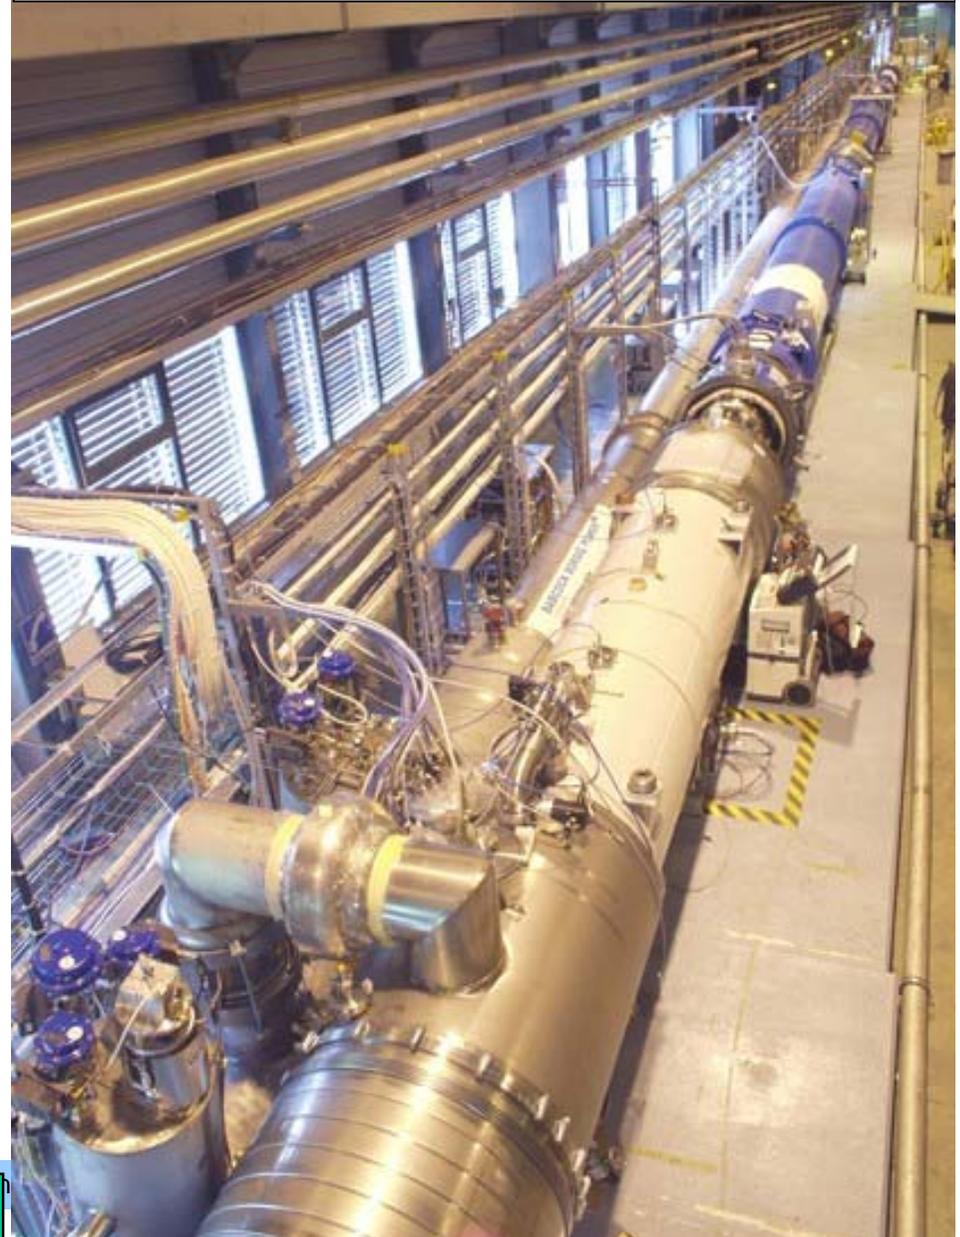

LHCb :
pp, B-physics

The LHC machine

First full LHC cell (~ 120 m long) :
6 dipoles + 4 quadrupoles;
successful tests at nominal current (12 kA)

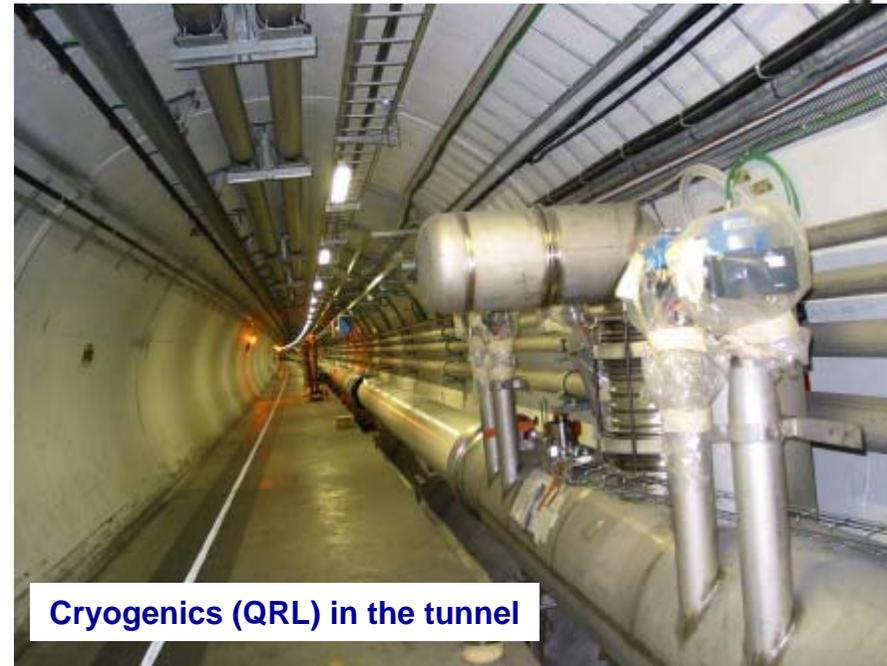

More than half of the 1232 dipoles are produced

LHC construction and installation

Dipoles ready for installation

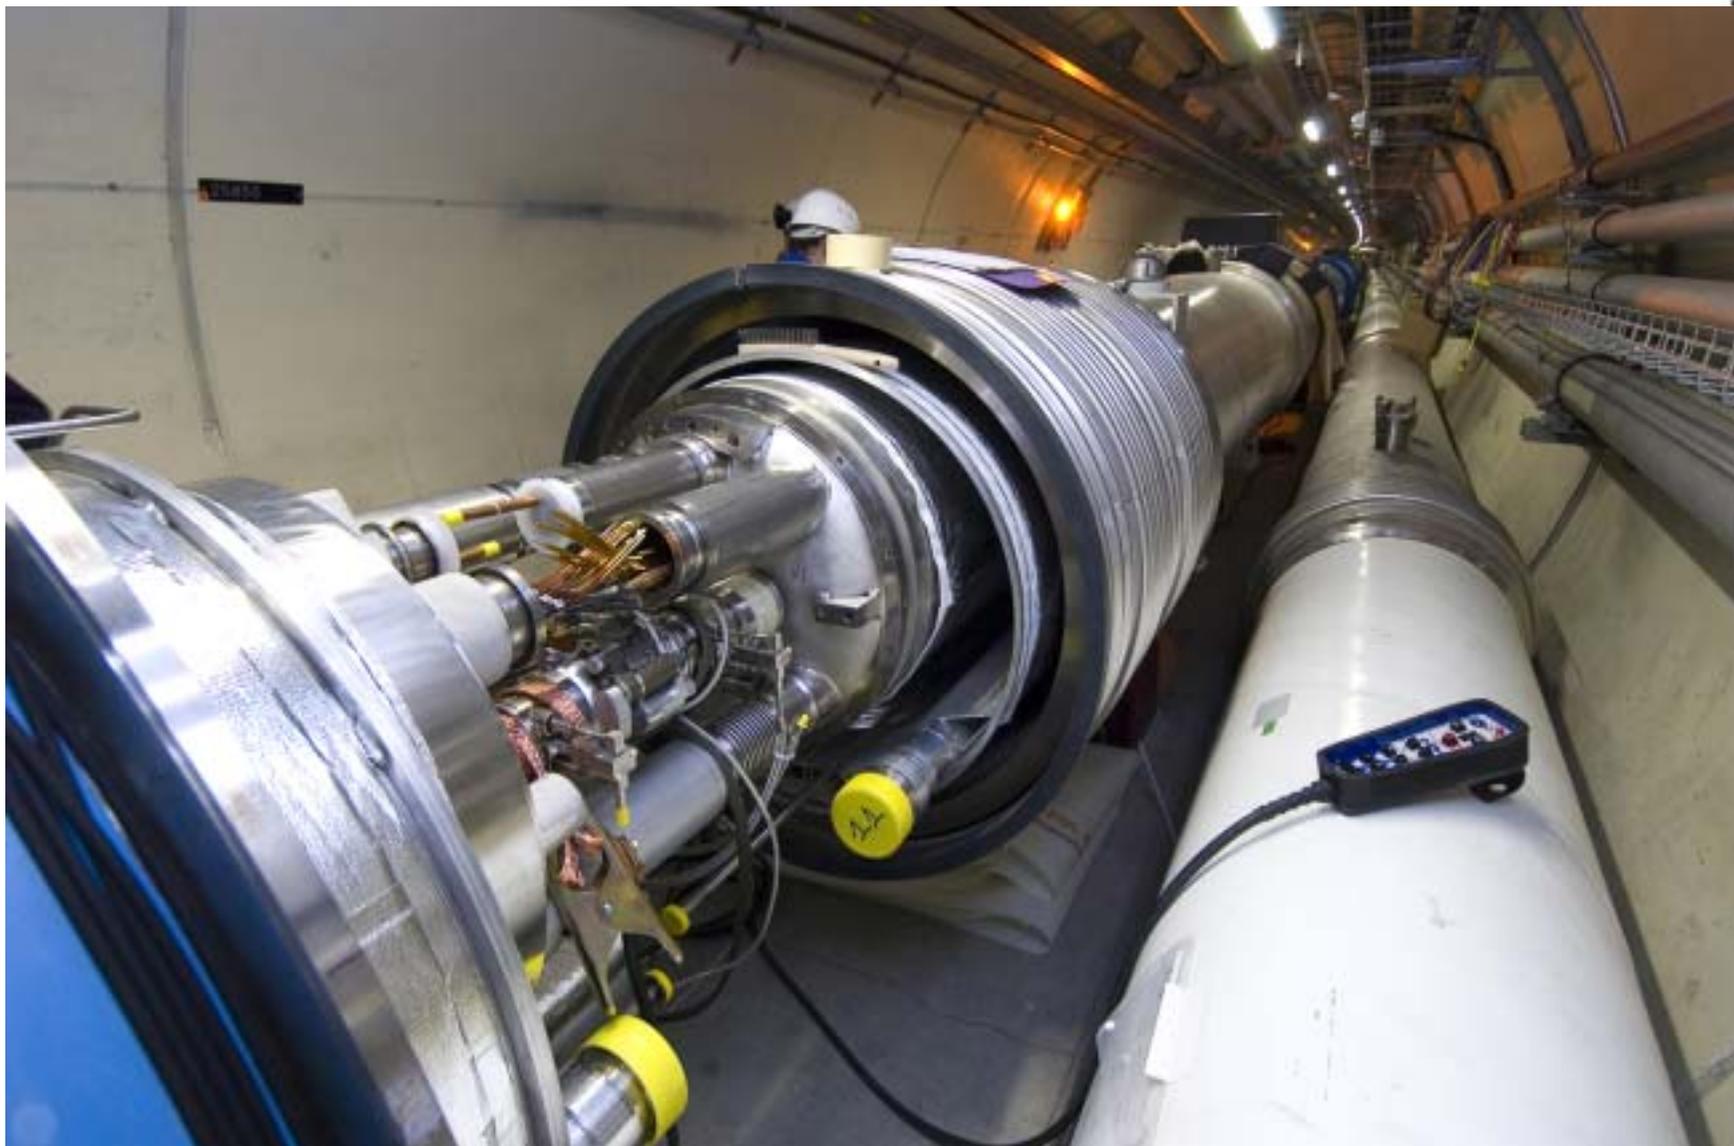

Cryogenics (QRL) in the tunnel

Dipole installation in the tunnel

The magnet production proceeds very well and is on schedule, also the quality of the magnets is very good

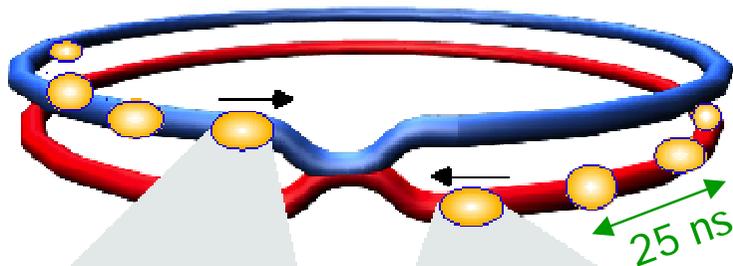

On the critical path for the first collisions, which are planned for Summer 2007, is the installation of the LHC in the tunnel, in particular due to delays in the cryogenic services lines (QRL) which initially had problems, and for which a recovery plan was implemented successfully

**Inner triplet
containing US
and Japanese
magnets**

Collisions at LHC

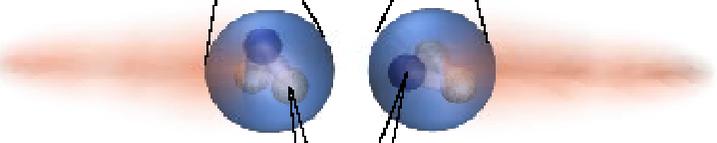

Proton-Proton	
Protons/bunch	10^{11}
Beam energy	7 TeV (7×10^{12} eV)
Luminosity	10^{34} cm ⁻² s ⁻¹

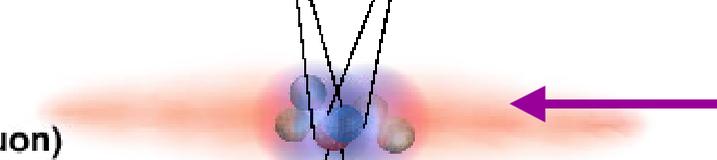

Bunch

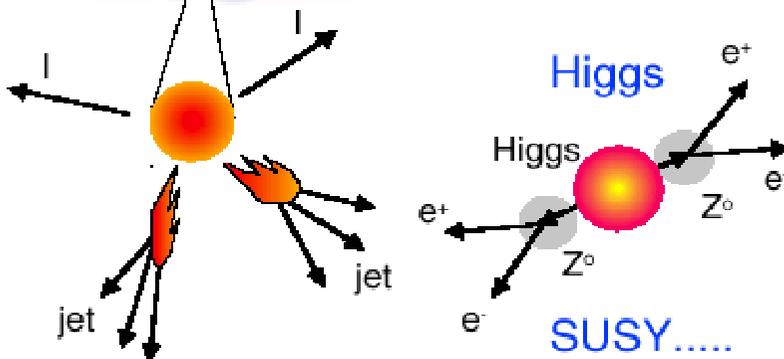

Proton

Parton
(quark, gluon)

Particle

Event rate in ATLAS :

$N = L \times \sigma (pp) \approx 10^9 \text{ interactions/s}$

Mostly soft (low p_T) events

← Interesting hard (high- p_T) events are rare

**Selection of 1 in
10,000,000,000,000**

→ very powerful detectors needed

The ATLAS physics goals

Search for the **Standard Model Higgs boson** over $\sim 115 < m_H < 1000 \text{ GeV}$

Search for **physics beyond the SM** (Supersymmetry, q/l compositeness, leptoquarks, W'/Z', heavy q/l, Extra-dimensions,) up to the **TeV-range**

Precise measurements :

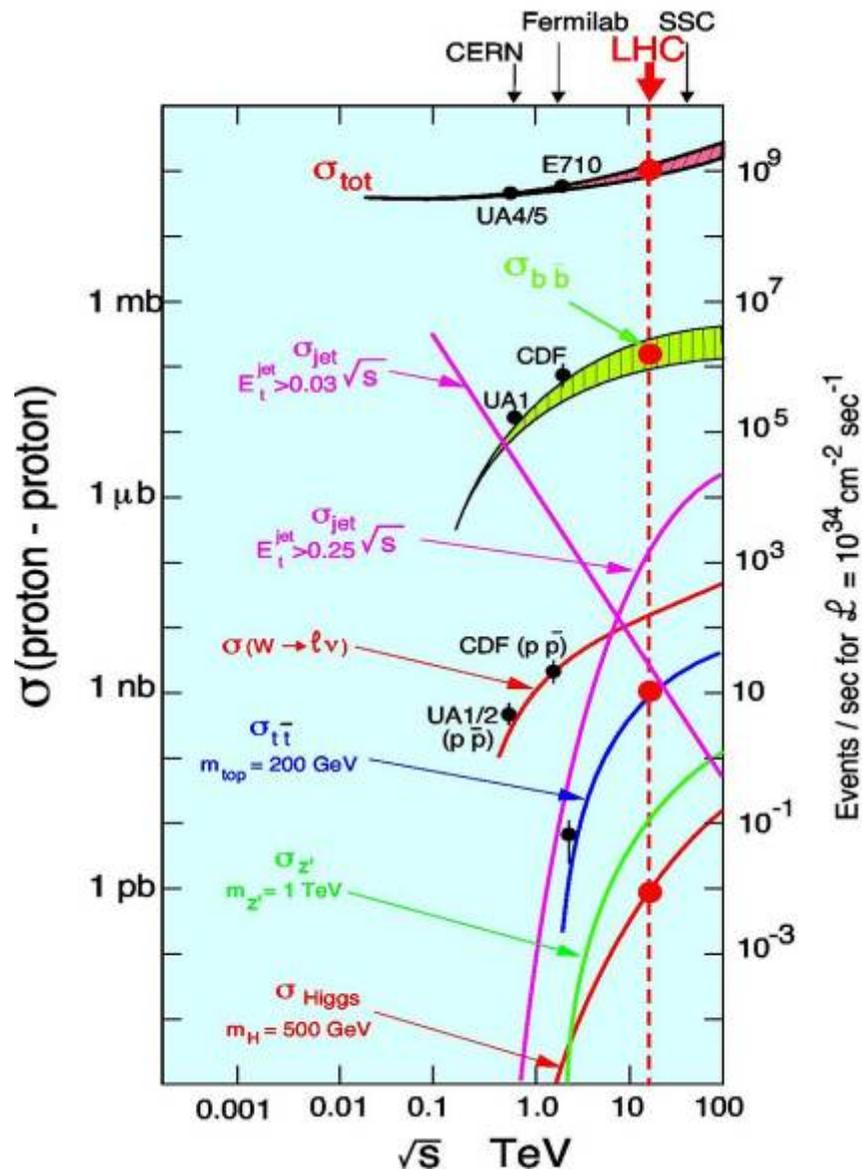

- **W mass**
- **top** mass, couplings and decay properties
- Higgs mass, spin, couplings (if Higgs found)
- **B-physics** (**complementing LHCb**): CP violation, rare decays, B^0 oscillations
- **QCD** jet cross-section and α_s
- etc.

Study of **phase transition** at high density from hadronic matter **to plasma** of deconfined quarks and gluons (complementing **ALICE**).

Transition plasma \rightarrow hadronic matter happened in universe $\sim 10^{-5}$ s after Big Bang

Etc. etc.

Cross Sections and Production Rates

Rates for $L = 10^{34} \text{ cm}^{-2} \text{ s}^{-1}$: (LHC)

• Inelastic proton-proton reactions:	$10^9 / \text{s}$
• bb pairs	$5 \cdot 10^6 / \text{s}$
• tt pairs	$8 / \text{s}$
• $W \rightarrow e \nu$	$150 / \text{s}$
• $Z \rightarrow e e$	$15 / \text{s}$
• Higgs (150 GeV)	$0.2 / \text{s}$
• Gluino, Squarks (1 TeV)	$0.03 / \text{s}$

LHC is a factory for:
top-quarks, b-quarks, W, Z, Higgs,

(The only problem: you have to detect them !)

Which physics the first year(s) ?

Expected event rates at production in ATLAS at $L = 10^{33} \text{ cm}^{-2} \text{ s}^{-1}$

Process	Events/s	Events for 10 fb^{-1}	<u>Total statistics collected</u> at previous machines by '07
$W \rightarrow e\nu$	15	10^8	10^4 LEP / 10^7 Tevatron
$Z \rightarrow ee$	1.5	10^7	10^7 LEP
$t\bar{t}$	1	10^7	10^4 Tevatron
$b\bar{b}$	10^6	$10^{12} - 10^{13}$	10^9 Belle/BaBar ?
H $m=130 \text{ GeV}$	0.02	10^5	?
$\tilde{g}\tilde{g}$ $m=1 \text{ TeV}$	0.001	10^4	---
Black holes $m > 3 \text{ TeV}$ ($M_D=3 \text{ TeV}, n=4$)	0.0001	10^3	---

➔ Already in first year, **large statistics** expected from:

- known SM processes → understand detector and physics at $\sqrt{s} = 14 \text{ TeV}$
- several New Physics scenarios

ATLAS Collaboration

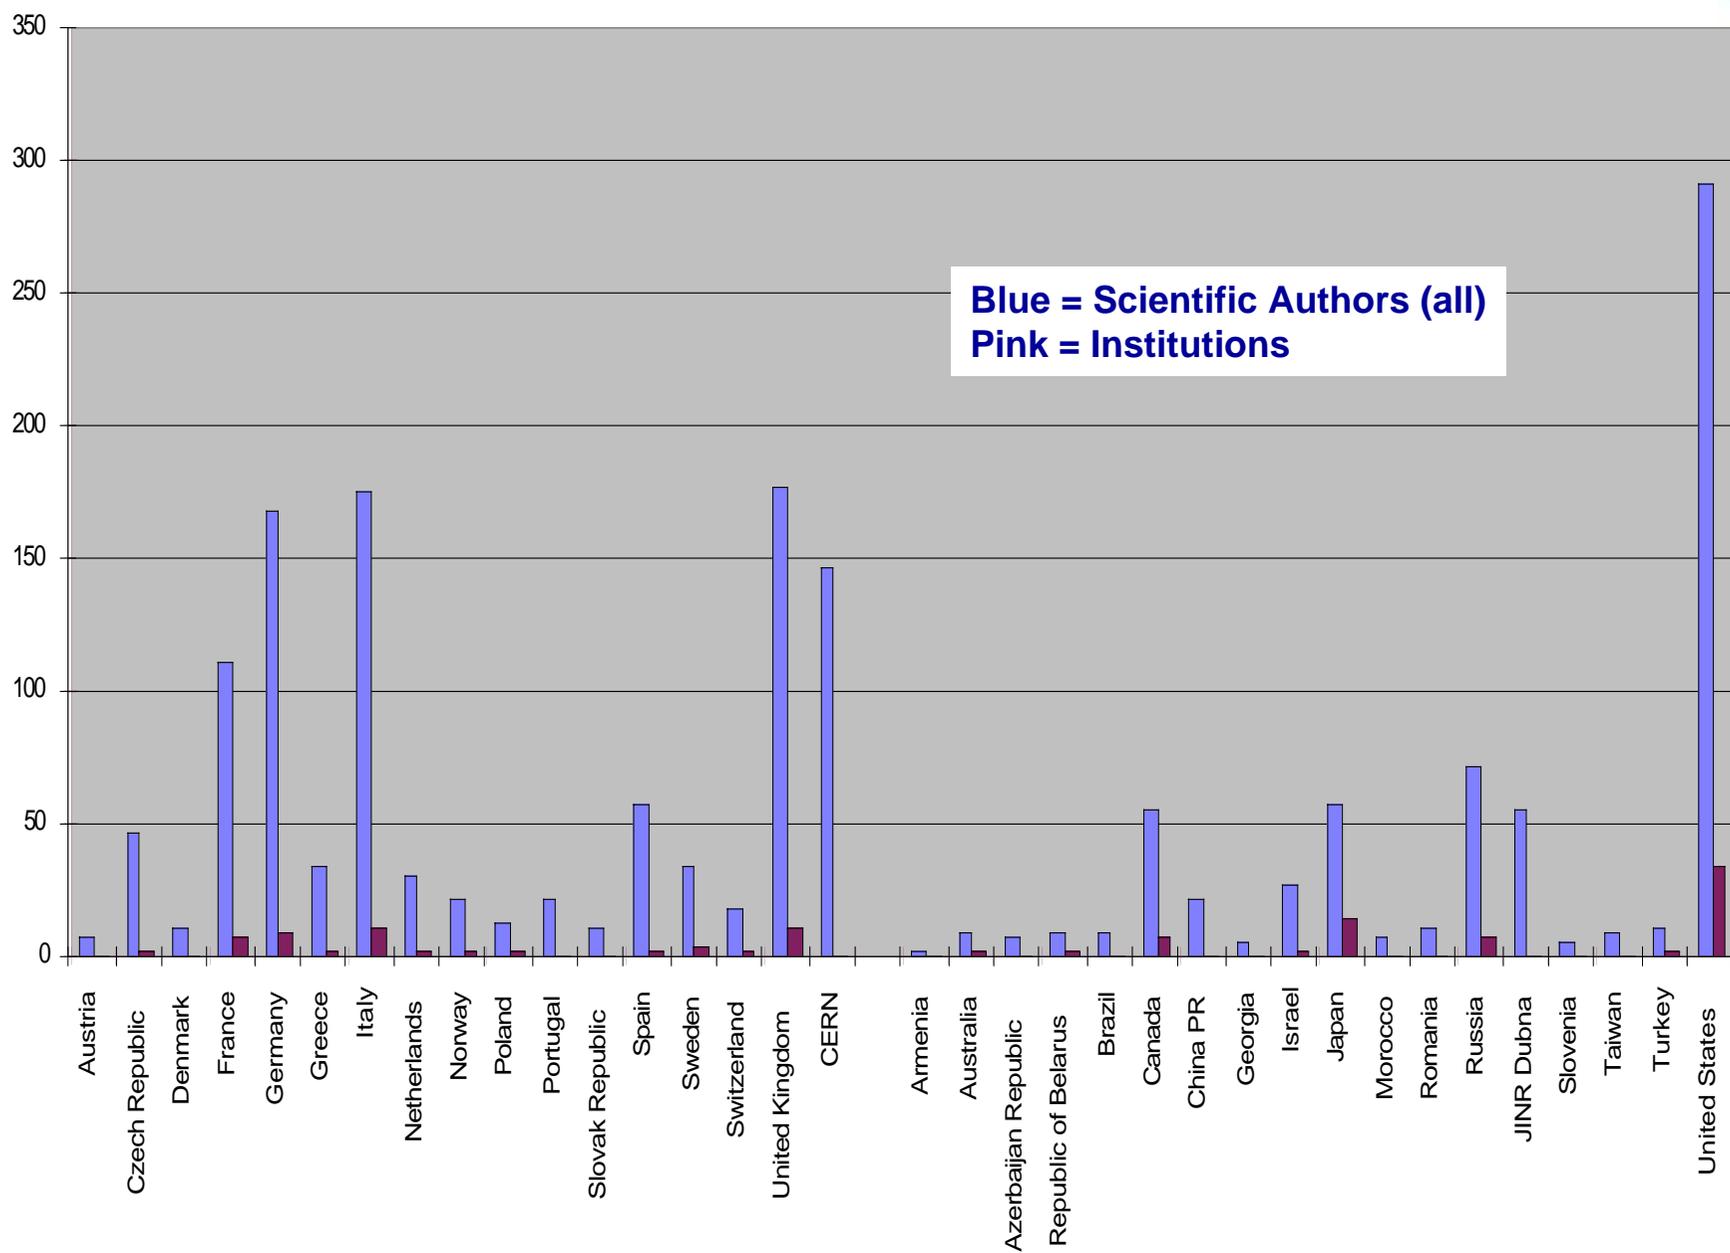

34 Countries
151 Institutions
1770 Scientific Authors

There is a long-standing excellent partnership with Japanese teams since the beginning (R&D started in 1990)

It is a particular pleasure to note a very fruitful cooperation with both teams from KEK and from the University of Tsukuba

air-core toroids with muon chambers

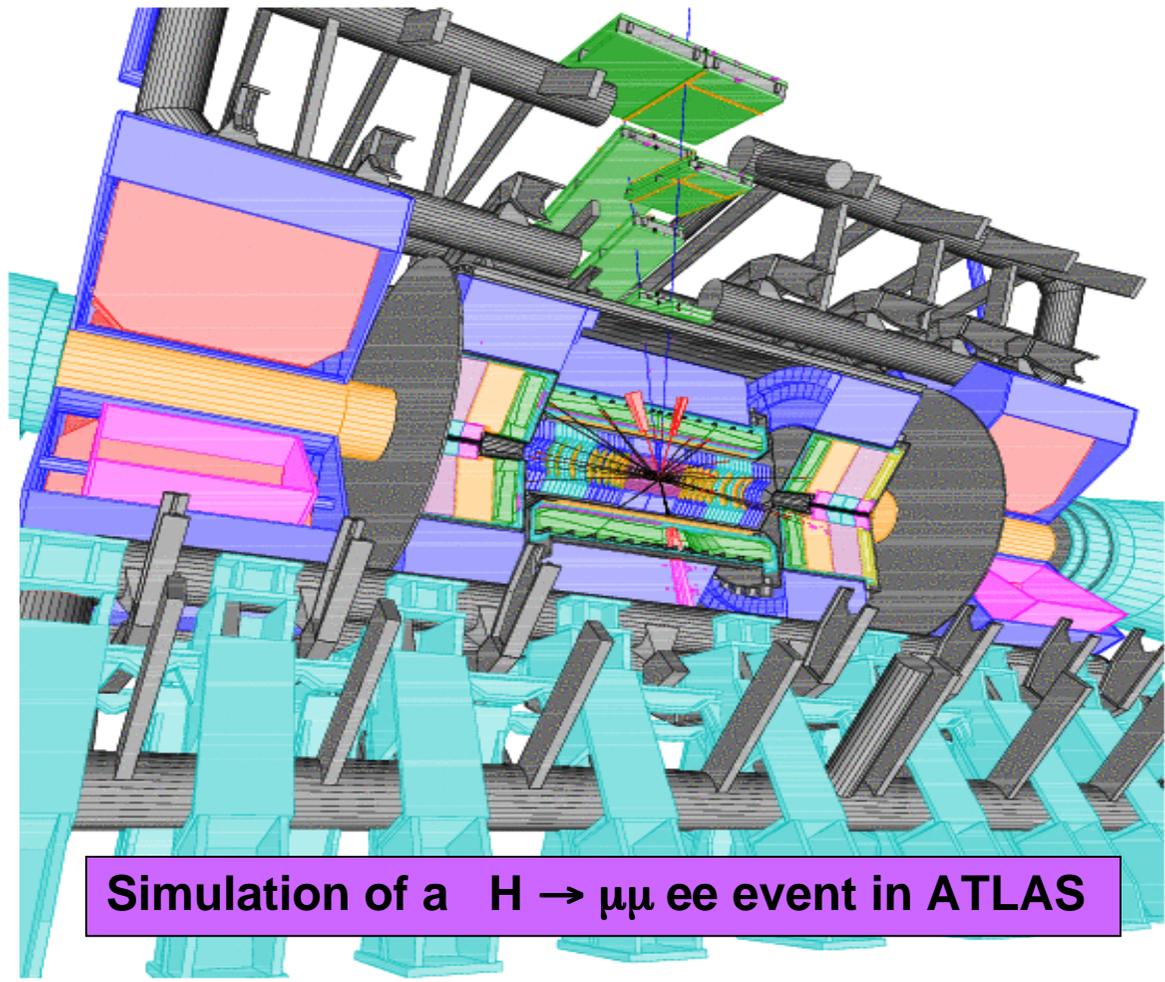

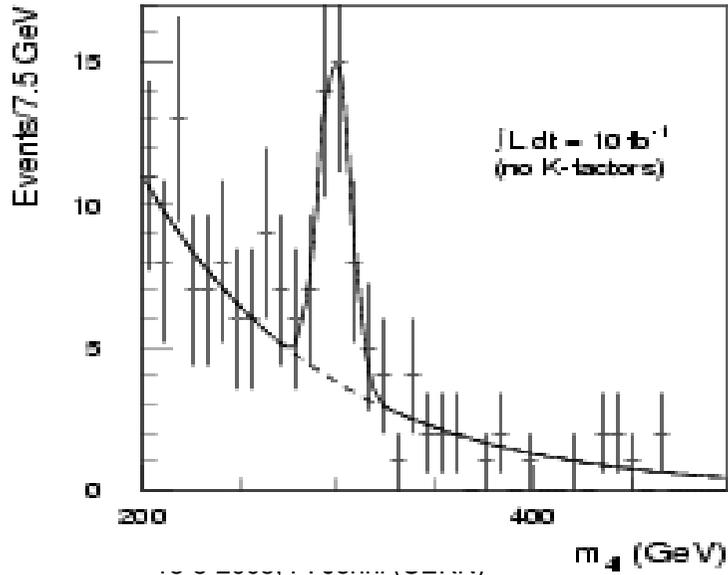

Physics example

$$H \rightarrow ZZ \rightarrow 4 \ell$$

“Gold-plated” channel for Higgs discovery at LHC

Signal expected in ATLAS after 1 year of LHC operation

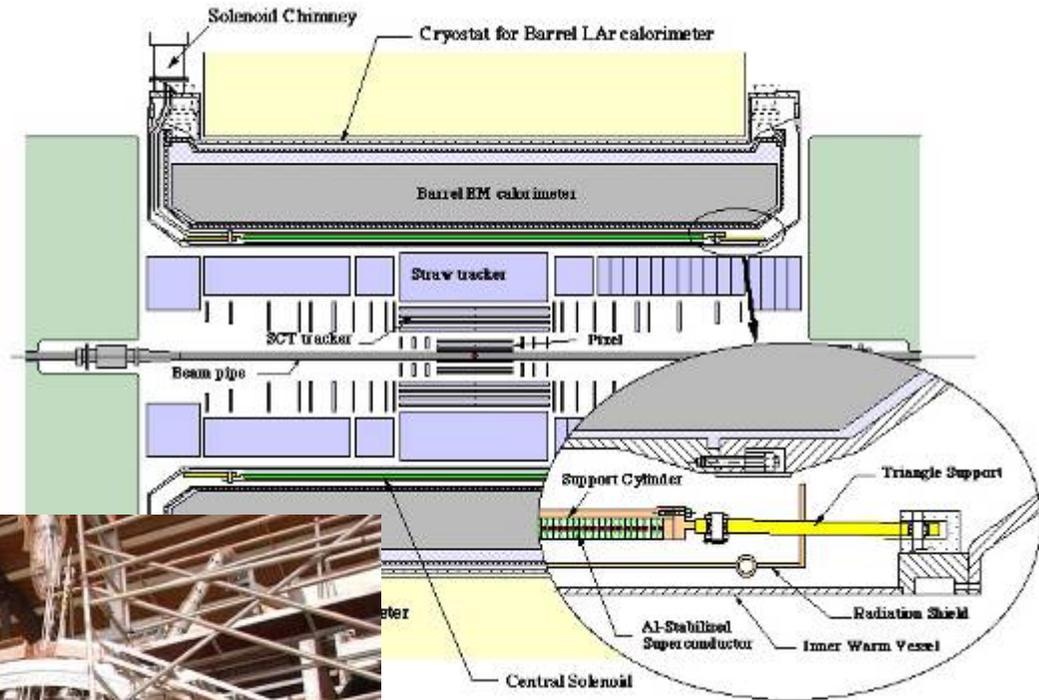

Magnet System

Central Solenoid

2T field with a stored energy of 38 MJ

Integrated design within the barrel LAr cryostat

The solenoid has been inserted into the LAr cryostat at the end of February 2004, and it was tested at full current (8 kA) during July 2004

(Engineered, constructed and tested under full responsibility of KEK)

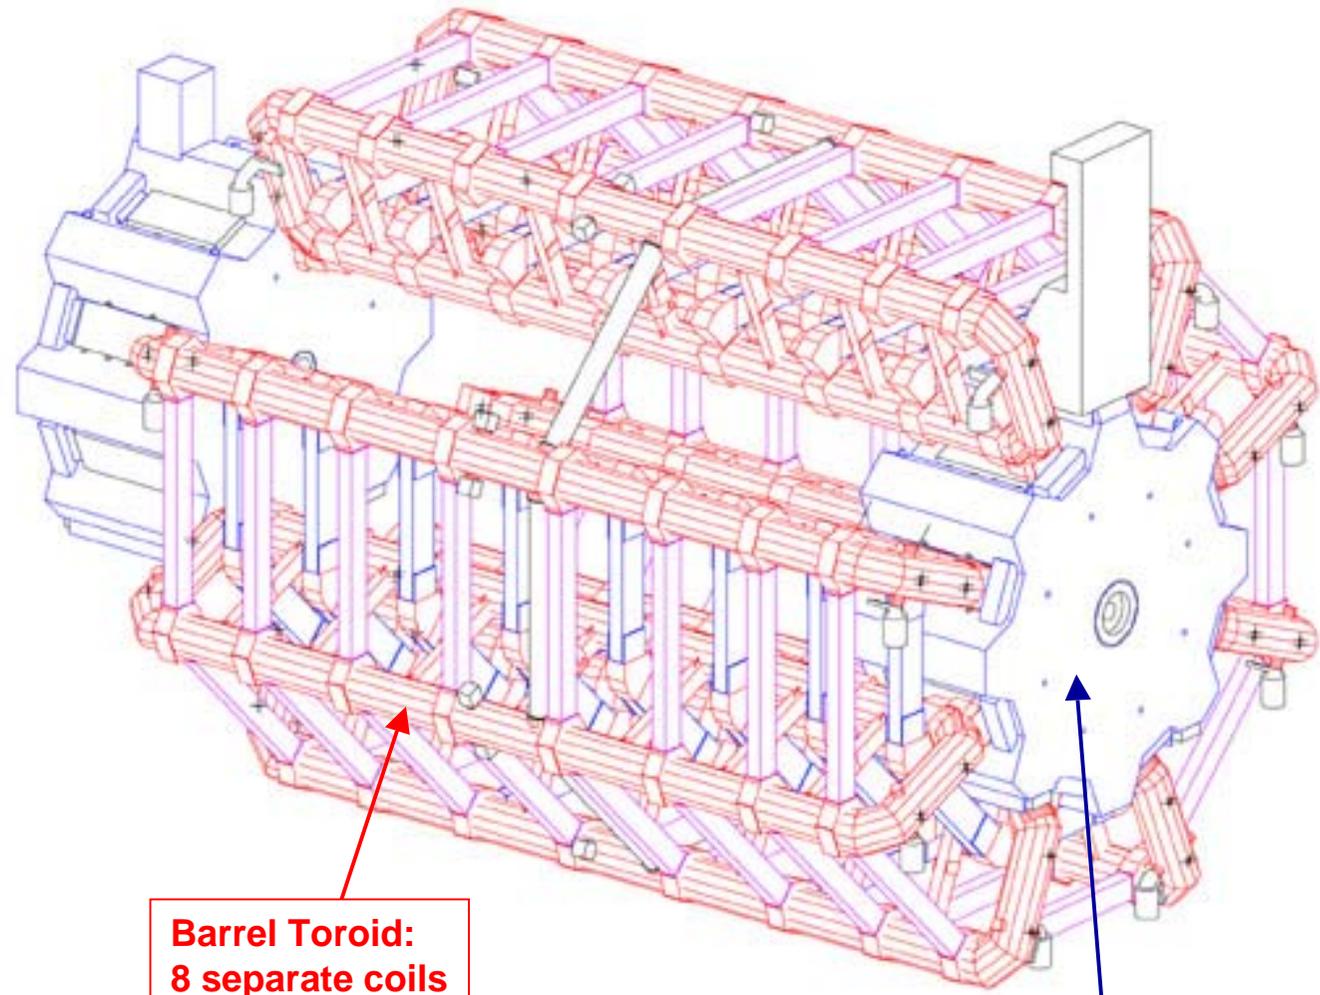

Toroid system

Barrel Toroid parameters

25.3 m length
20.1 m outer diameter
8 coils
1.08 GJ stored energy
370 tons cold mass
830 tons weight
4 T on superconductor
56 km Al/NbTi/Cu conductor
20.5 kA nominal current
4.7 K working point

End-Cap Toroid parameters

5.0 m axial length
10.7 m outer diameter
2x8 coils
2x0.25 GJ stored energy
2x160 tons cold mass
2x240 tons weight
4 T on superconductor
2x13 km Al/NbTi/Cu conductor
20.5 kA nominal current
4.7 K working point

**Barrel Toroid:
8 separate coils**

**End-Cap Toroid:
8 coils in a common cryostat**

Barrel Toroid construction status

Series integration and tests of the 8 coils at the surface will be finished in June 2005

BT1 – BT4 are installed in the cavern

BT5 Ready at the pit for installation

BT6 Tests finished

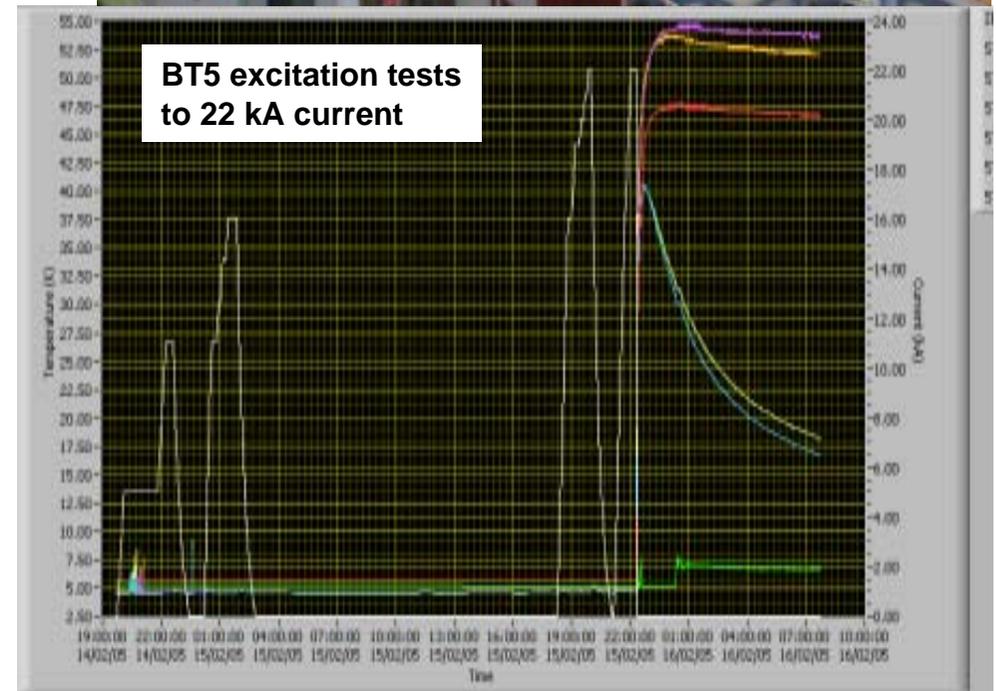

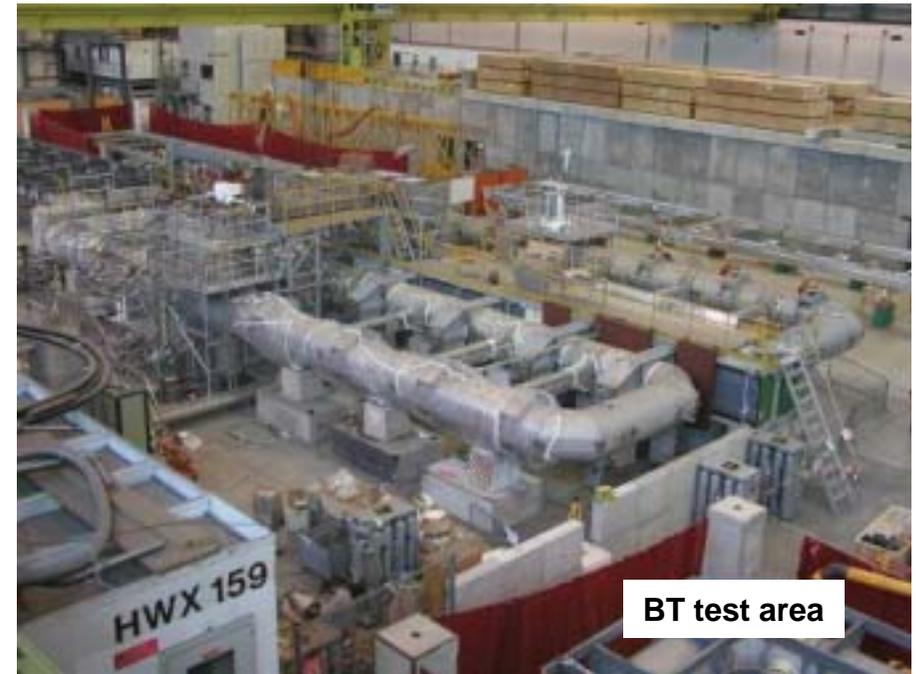

BT7 On the test station, tests almost complete

BT8 Ready in a few weeks for starting the tests

Schedule for installation and commissioning in the cavern:

BT8 installation in July 2005

BT functional test by end of 2005

Barrel Toroid coil transport and installation

Inner Detector (ID)

The Inner Detector (ID) is organized into four sub-systems:

Pixels

($0.8 \cdot 10^8$ channels)

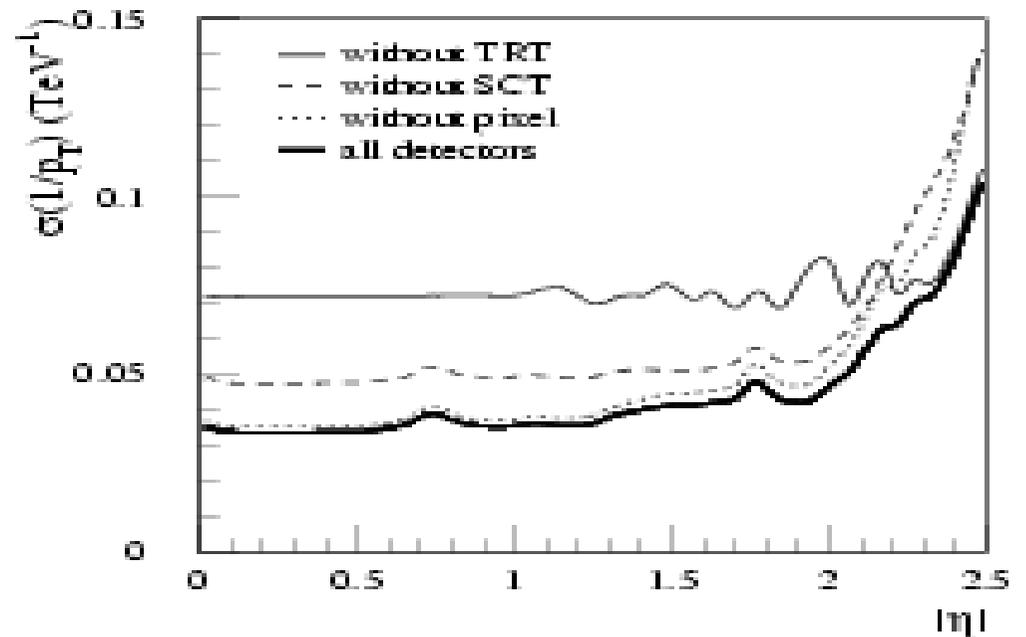

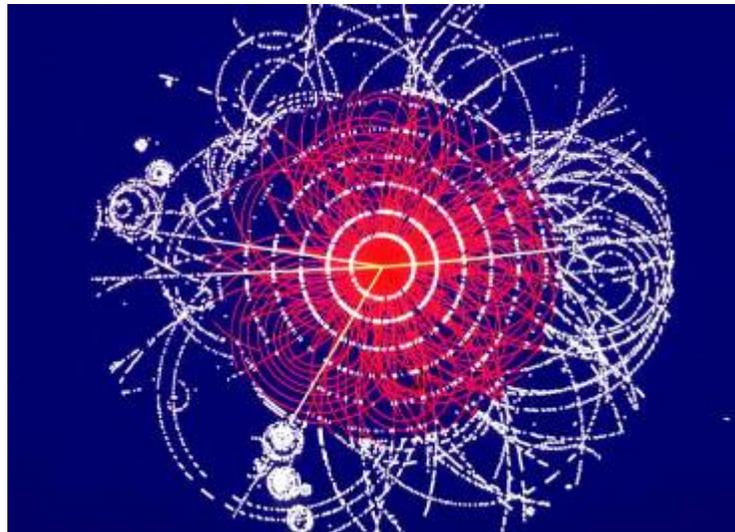

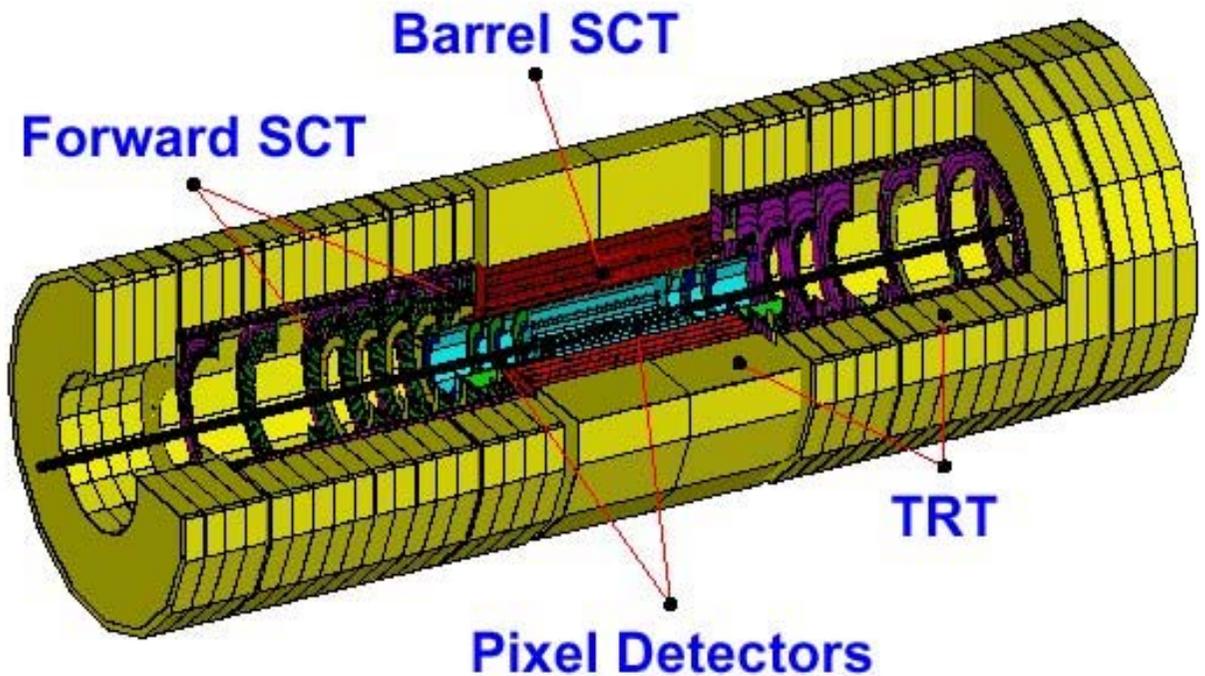

Silicon Tracker (SCT)

($6 \cdot 10^6$ channels)

Transition Radiation Tracker (TRT)

($4 \cdot 10^5$ channels)

Common ID items

Inner Detector Progress Summary

Pixels: Steady 'on-schedule' progress on all aspects of the sub-system for 3 layers

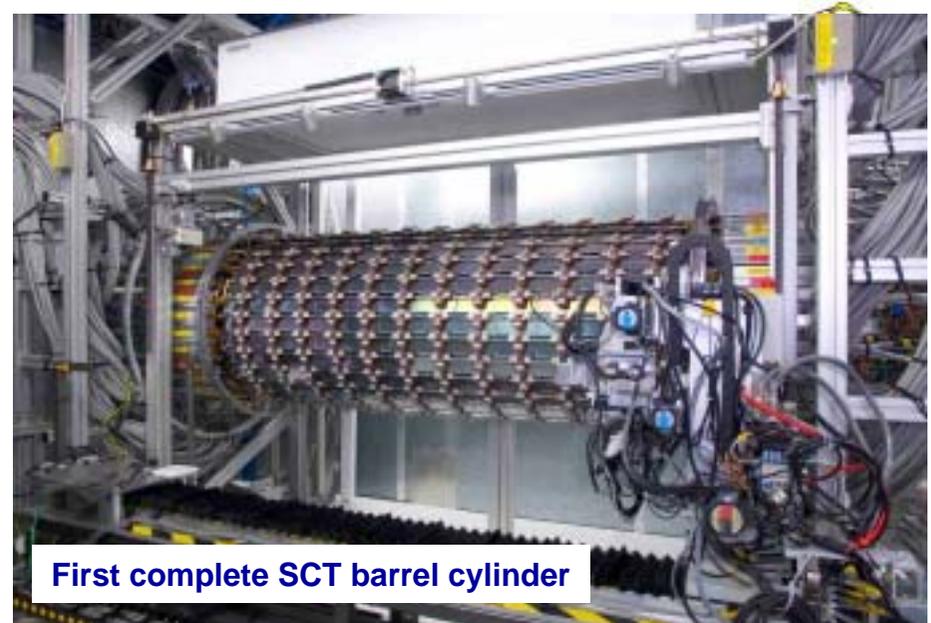

SCT: Module mounting ('macro-assembly') on the 4 barrel cylinders ongoing (the first cylinder is finished and tested, and is now at CERN)

The module mounting progressing on the forward disks (the first 4 disks are completed)

TRT: Barrel module mounting into support structure is completed

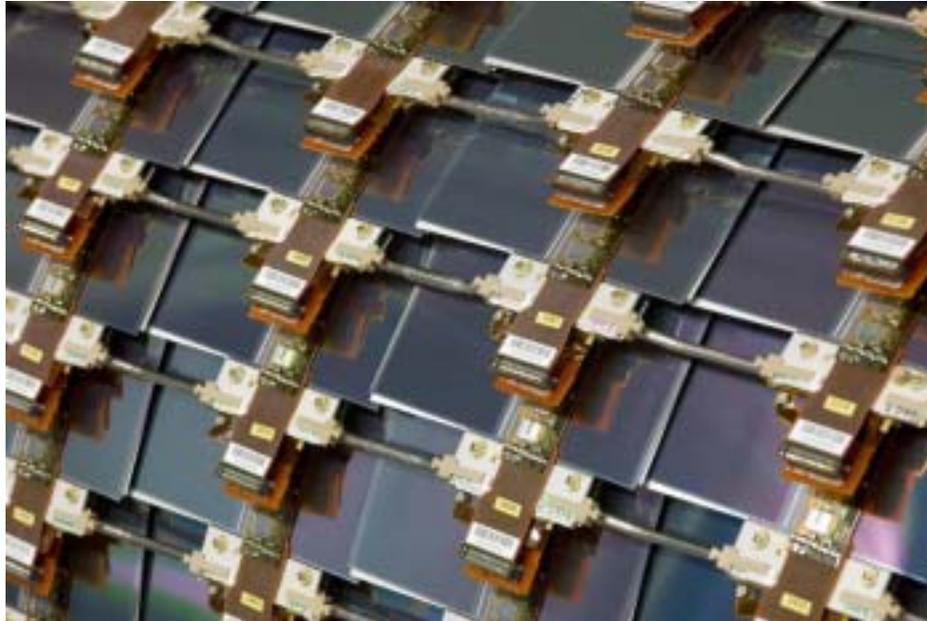

End-cap wheel production is now also smooth, and the stacking at CERN into the end-cap structures has started

The schedule for the Inner Detector remains very tight, without any float left (critical path: all SCT, and second TRT end-cap)

SCT

The barrel module production is complete, for the end-caps more than 70% are made

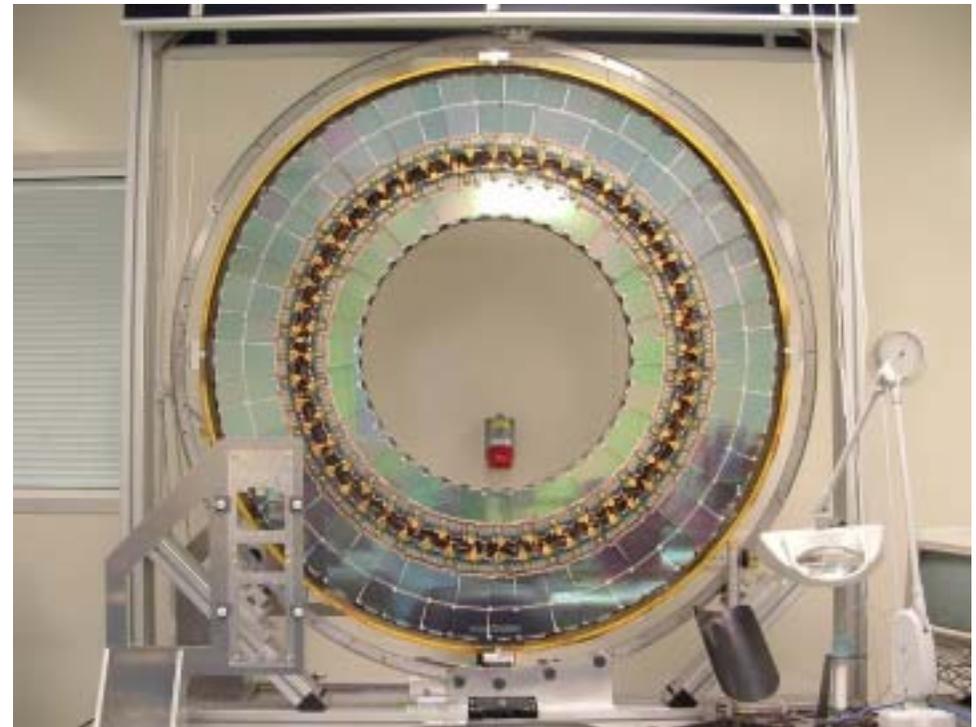

The first four of the 18 disks for both end-caps have been mounted

This operation is late and on the critical path for various reasons including delays accumulated for the services

The first of the four barrel cylinders has been completed and delivered to CERN, tested in cooled operation conditions with good initial results (< 0.3% channels have problems)

Mounting on the three other cylinders is ongoing, increased manpower is required to meet the schedule

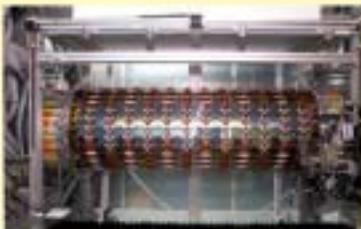

ATLAS Supplier Award

In recognition of excellent supplier performance

ATLAS Supplier Award for Hamamatsu Photonics

Supply of Silicon Microstrip Sensors for the ATLAS SemiConductor Tracker

A cylindrical SCT barrel structure, radius 299 mm, length 1431 mm, filled with rectangular modules constructed using silicon sensors supplied by Hamamatsu Photonics.

Hamamatsu Photonics has supplied 17,000 of the p-n single-sided silicon microstrip sensors that make up the detecting element of the ATLAS SemiConductor Tracker. The sensors are of six different shapes, each having 740 ac-coupled readout strips at a pitch close to 60 μm .

The final design details and specifications were developed during several years of collaborative R&D between Hamamatsu Photonics and ATLAS Institutes. The challenge was to produce sensors with high strip quality and efficiency that could withstand the high radiation levels to be experienced in ATLAS, operating at high bias voltages after type-inversion.

The sensors supplied were of uniformly excellent quality, well in excess of the requirements of the technical specification. They were delivered over a three-year period to the agreed schedule and cost.

The ATLAS Collaboration greatly appreciates the help, the flexible attitude and the enormous contribution of Hamamatsu Photonics to the experiment.

Geneva, May 2005

Close-up view of a 62.5 mm x 120 mm rectangular readout module.

An endcap disk, outer radius 540 mm, filled with wedge-shaped silicon modules.

Dr. Peter Jenni
ATLAS Spokesperson

Dr. Masaru
CERN Secretary

Japanese physicists and industry are playing a crucial role in the SCT project!

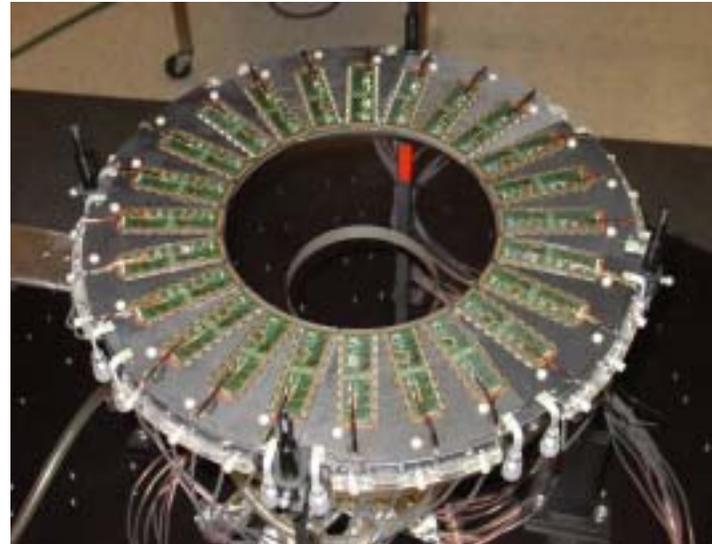

Pixels

All FE chips have been delivered (all tested, showing a yield of 82%)

The sensor production is finished for 2 layers, and on time for 3 layers

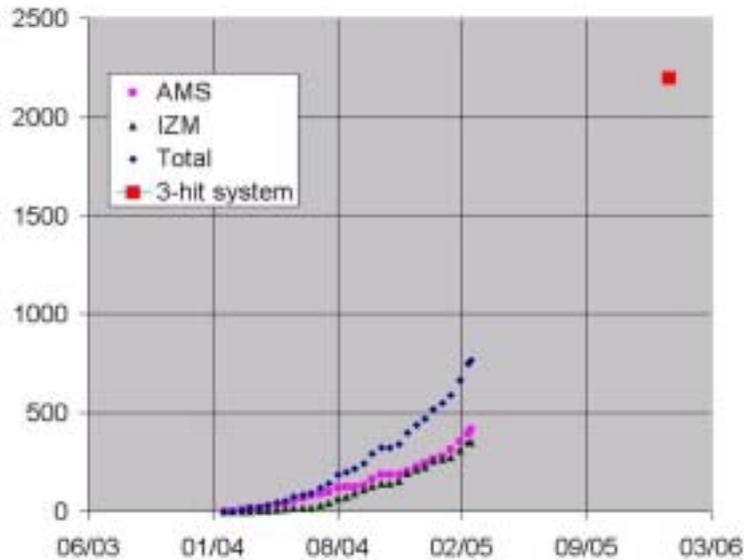

The module production rate (with bump-bonding in 2 industries) has improved, on track for 3 layers in time

First completed disk (two layers of 24 modules each, with 2'200'000 channels of electronics)

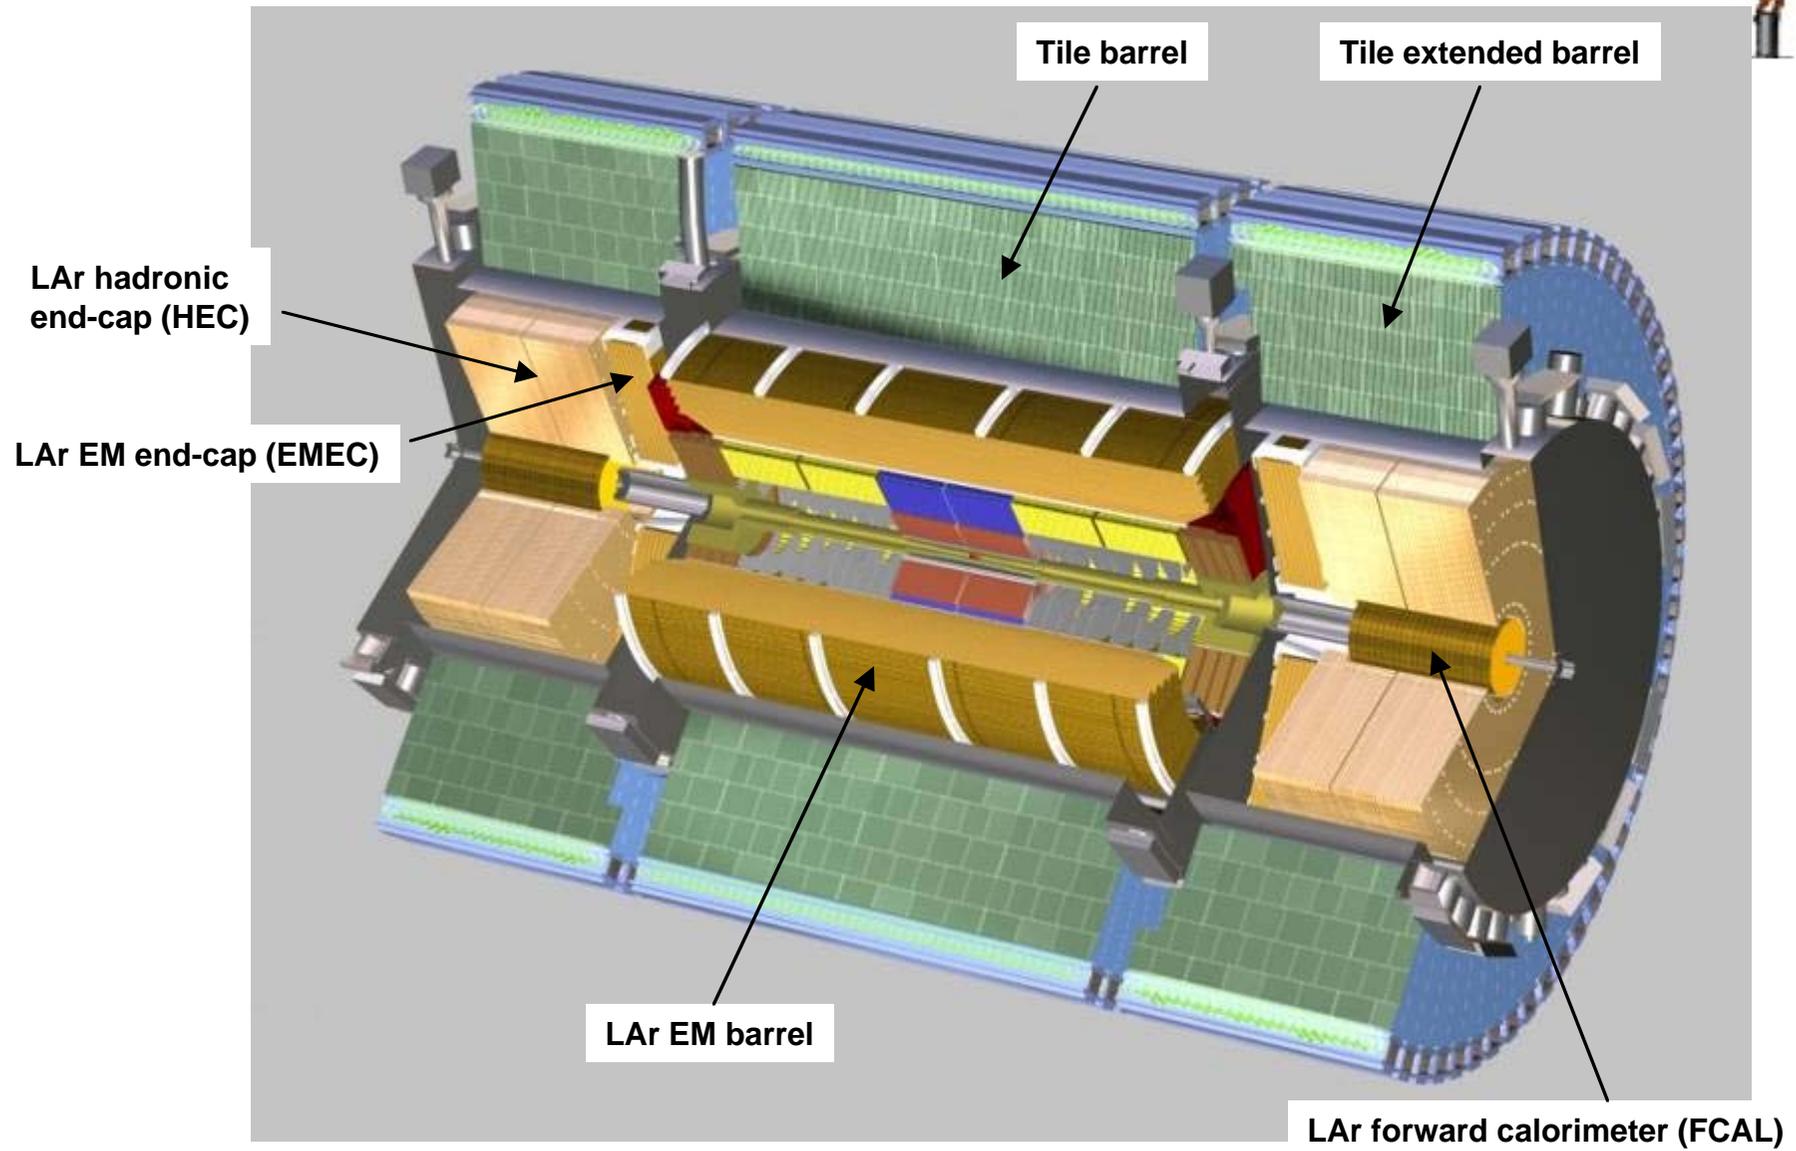

ATLAS pixel bare modules

The series production of final staves (barrel) and sectors (end-cap disks) has passed the 10% mark, this activity is now on the critical path of the Pixel project

LAr and Tile Calorimeters

LAr EM Barrel Calorimeter and Solenoid Commissioning at the Surface

The barrel EM calorimeter is installed in the cryostat, and after insertion of the solenoid, the cold vessel was closed and welded

A successful complete cold test (with LAr) was made during summer 2004 in hall 180

End of October the cryostat was transported to the pit, and lowered into the cavern

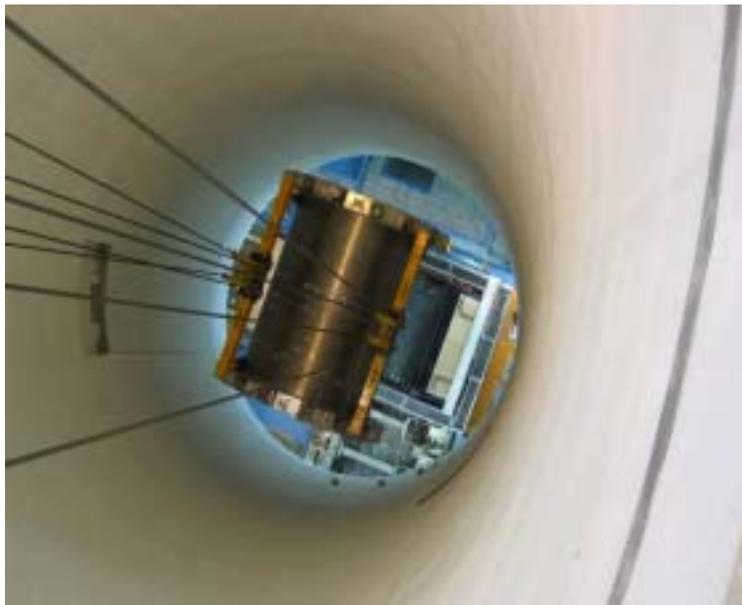

LAr barrel EM calorimeter after insertion into the cryostat

Solenoid just before insertion into the cryostat

***Professor Masatoshi Koshiba visiting the ATLAS LAr barrel cryostat
(8th July 2003)***

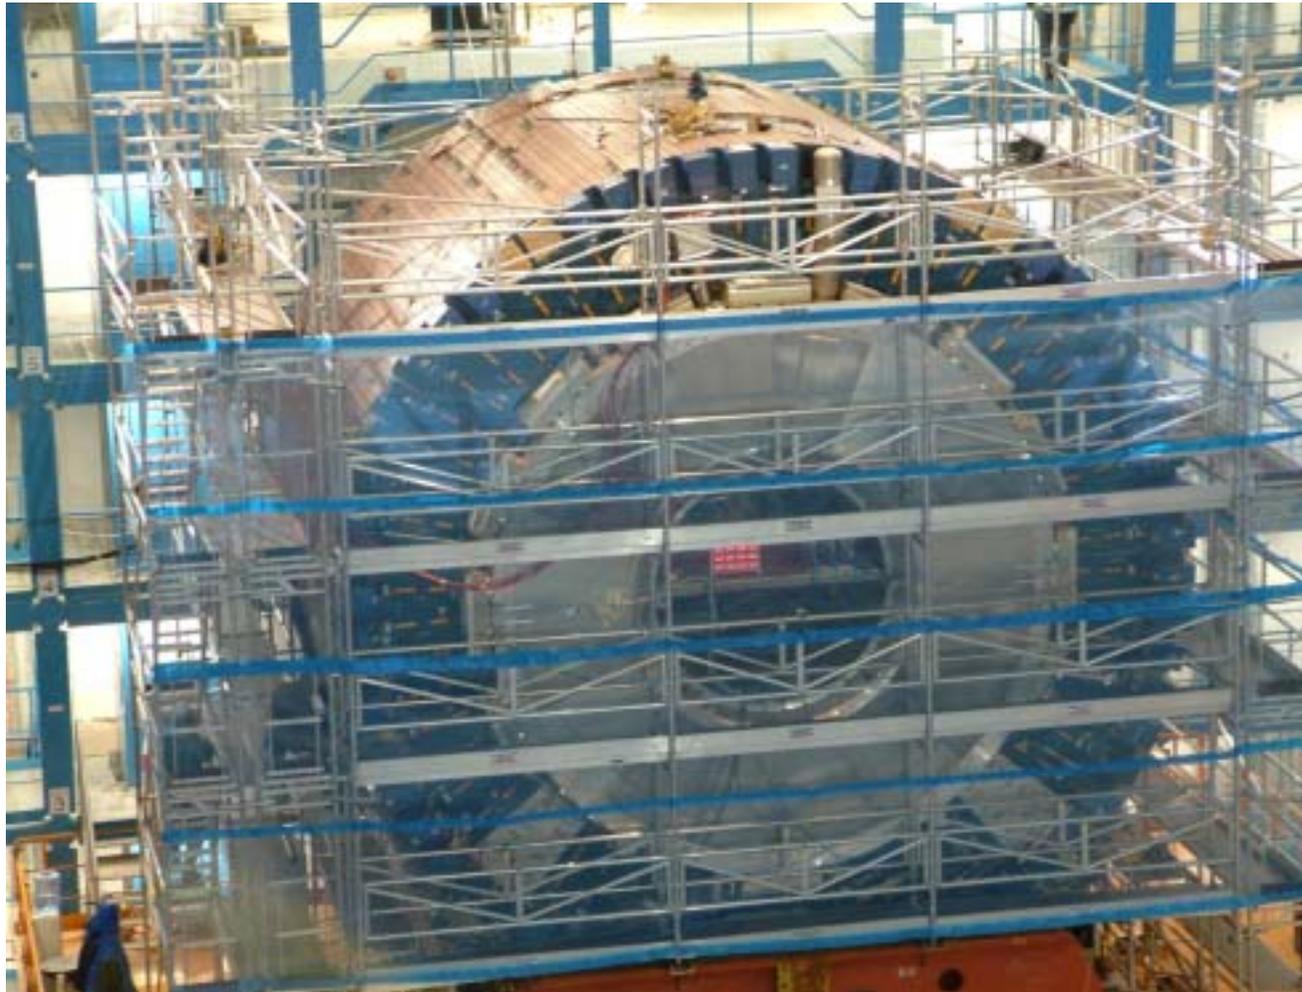

ATLAS Barrel Calorimeter

The mechanical installation of the LAr and Tile Barrel Calorimeters in the pit has been completed end of 2004 on the support trucks below the access shaft on the C-side

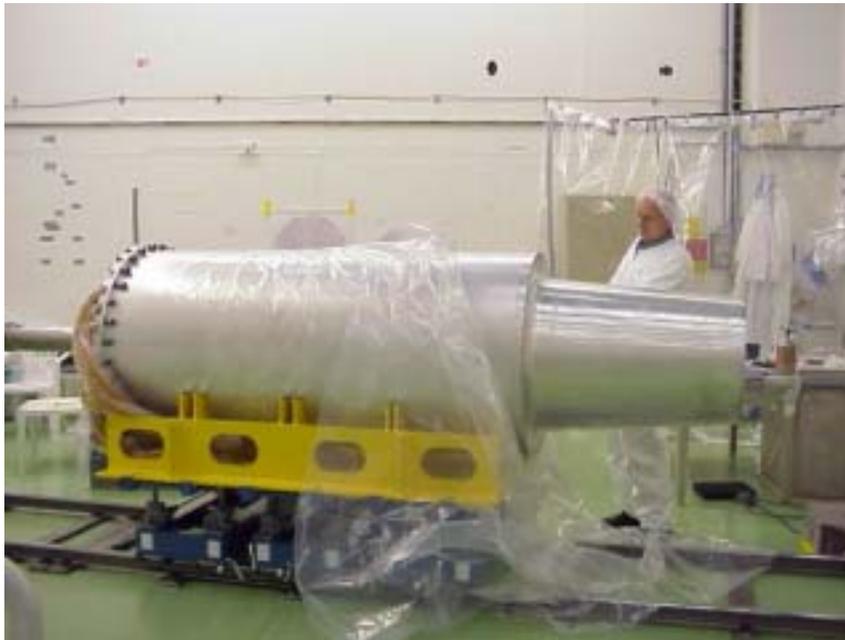

The installation of electronics and services is ongoing

LAr End-Caps

End-Cap C: Surface cold tests with LAr are finished, with very good preliminary results

End-Cap A: Integration is finished, and cool down for surface test started

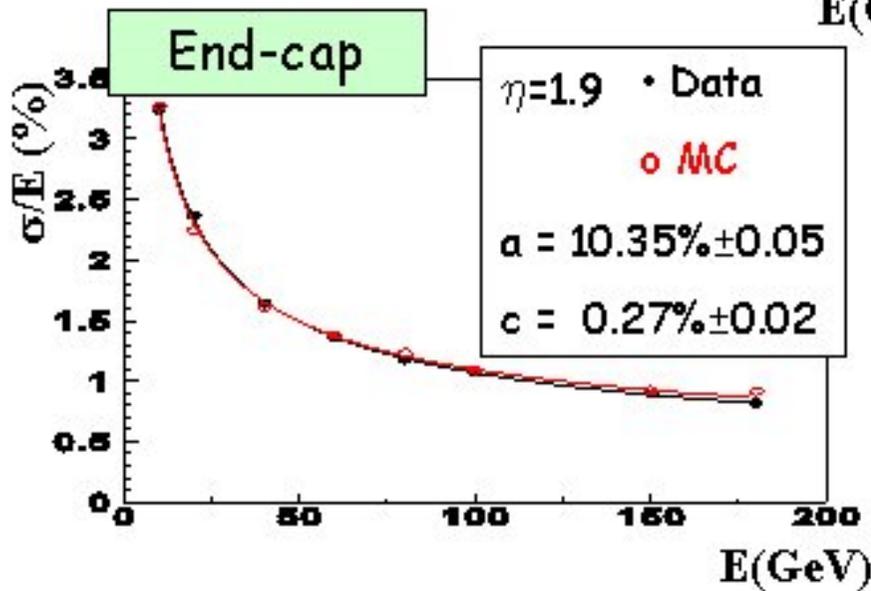

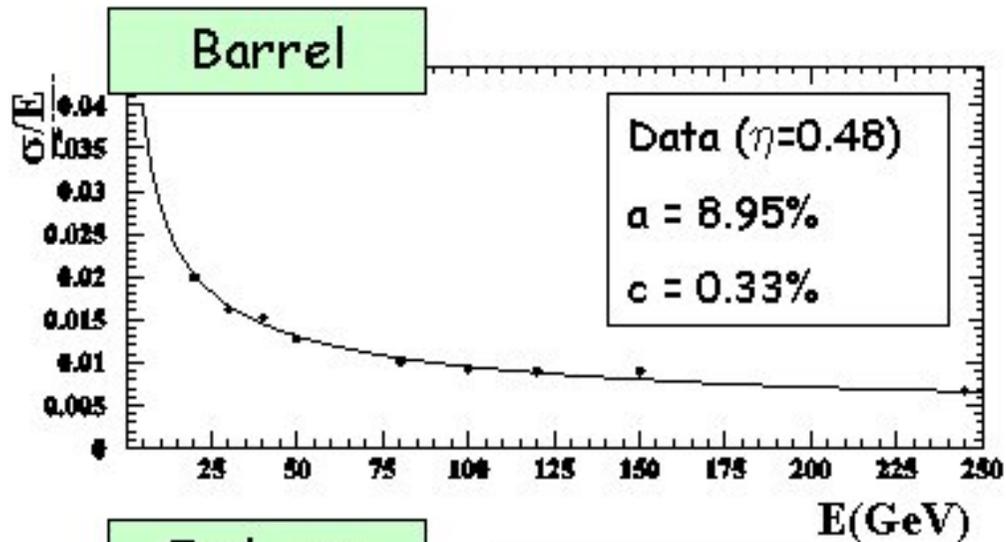

FCAL A before insertion

End-Cap cryostat A before closure

EM beam test results: Energy resolution

$$\sigma_{\sqrt{E}} = a/\sqrt{E} \oplus c \oplus n/E$$

For every tested points:

Barrel	End-cap
$a < 10\%$	$a < 12.5\%$
$c < 0.4\%$	$c < 0.5\%$

- Within specifications
- Good agreement with MC

Impact on Higgs mass resolution

Simulations, $m_H=130$ GeV

✓ $H \rightarrow \gamma\gamma$

Resolution: 1% (low lum)

1.2% (high lum)

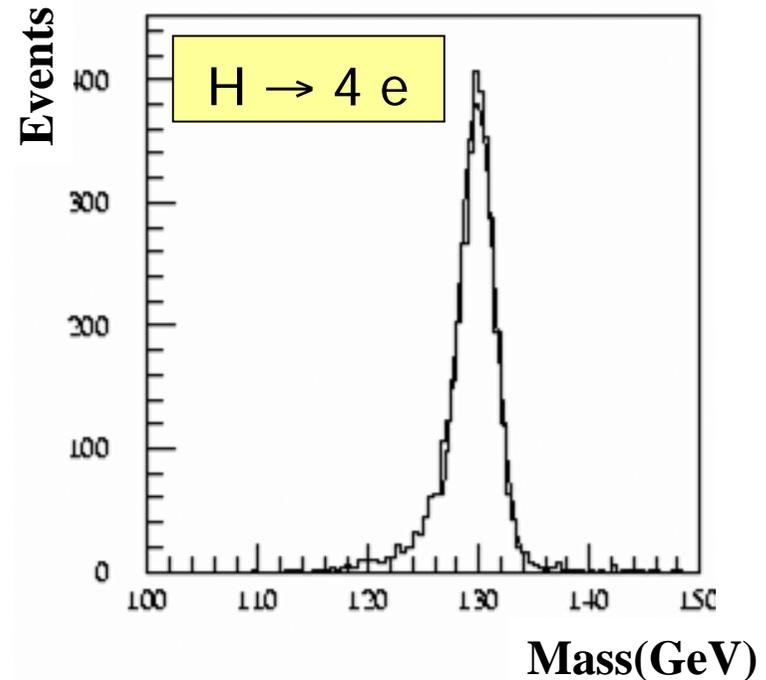

Acceptance: 80% within $\pm 1.4 \sigma$

✓ $H \rightarrow 4e$

Resolution: 1.2% (low lum)

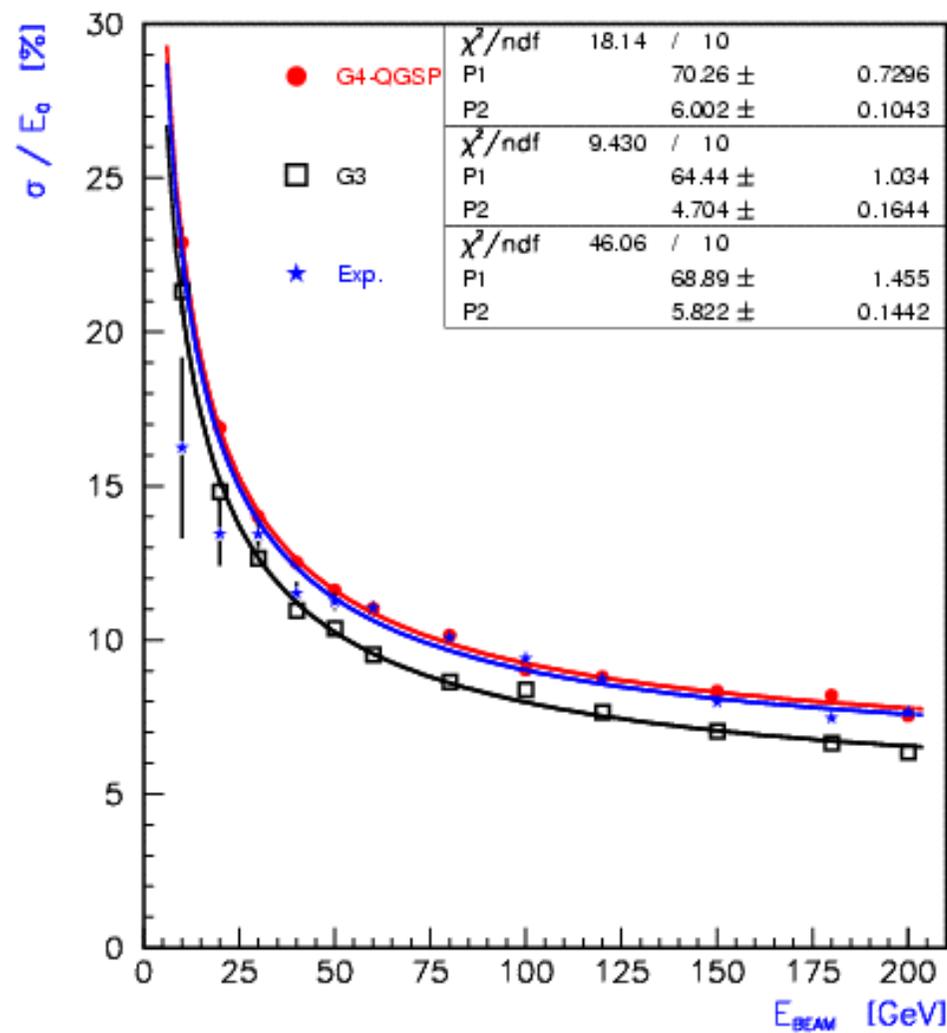

1.4% (high lum)

Acceptance: 84% within $\pm 2 \sigma$

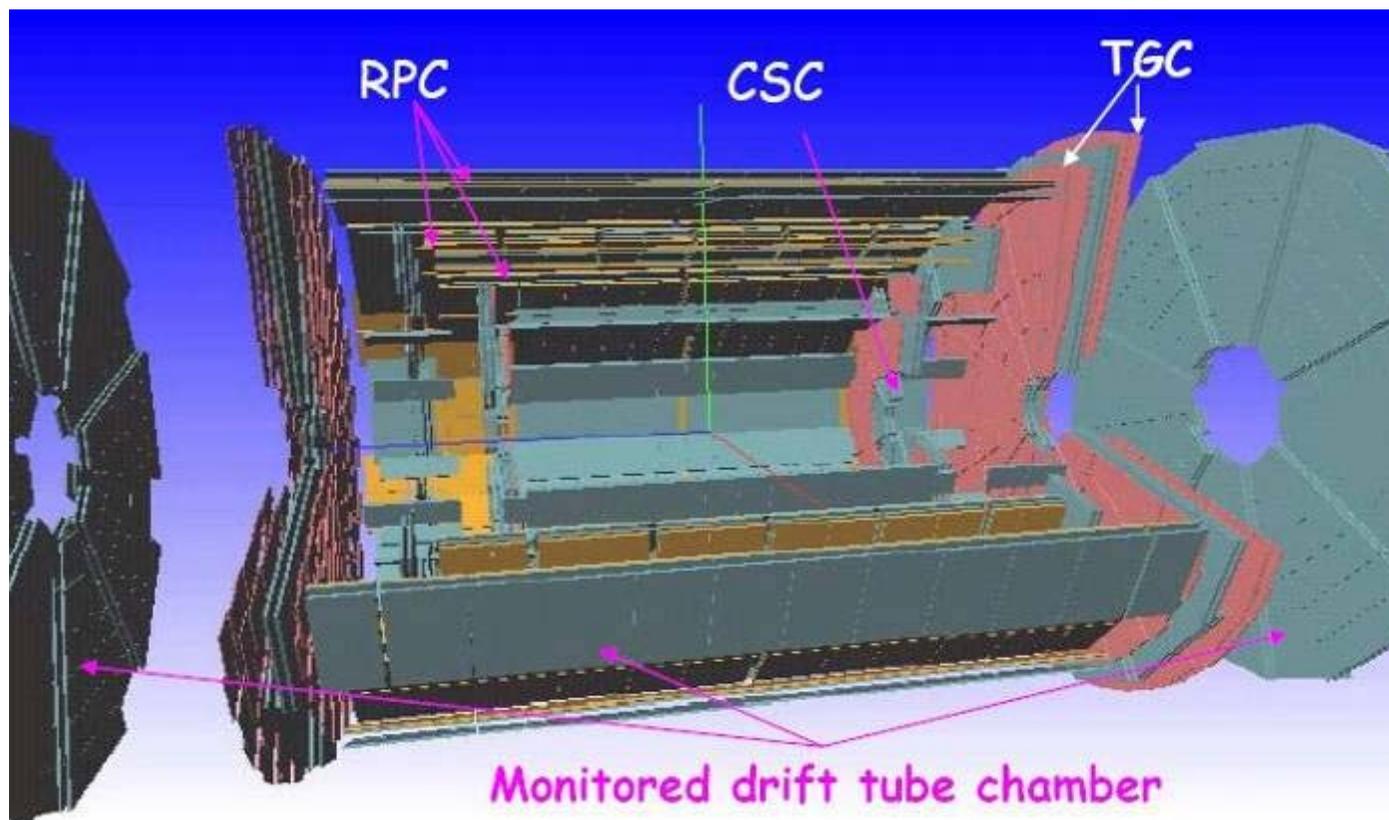

π^\pm E-resolution
from ATLAS
had. calorimeter
test beam data:
 $\sim 70\%/\sqrt{E}$

Muon Spectrometer Instrumentation

The Muon Spectrometer is instrumented with precision chambers and fast trigger chambers

A crucial component to reach the required accuracy is the sophisticated alignment measurement and monitoring system

Precision chambers:

- MDTs in the barrel and end-caps
- CSCs at large rapidity for the innermost end-cap stations

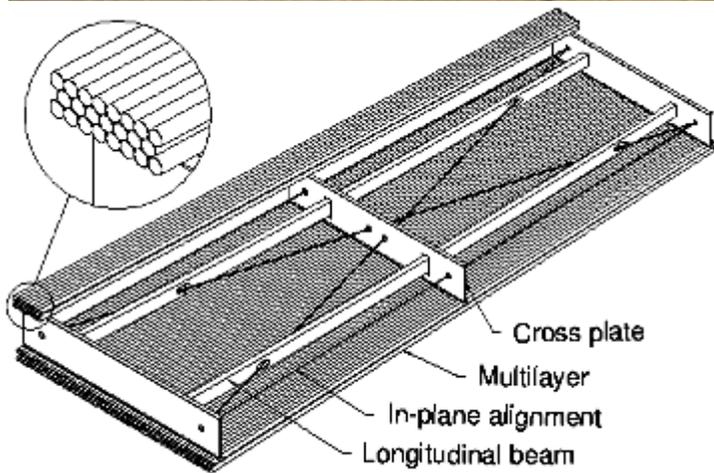

Trigger chambers:

- RPCs in the barrel
- TGCs in the end-caps

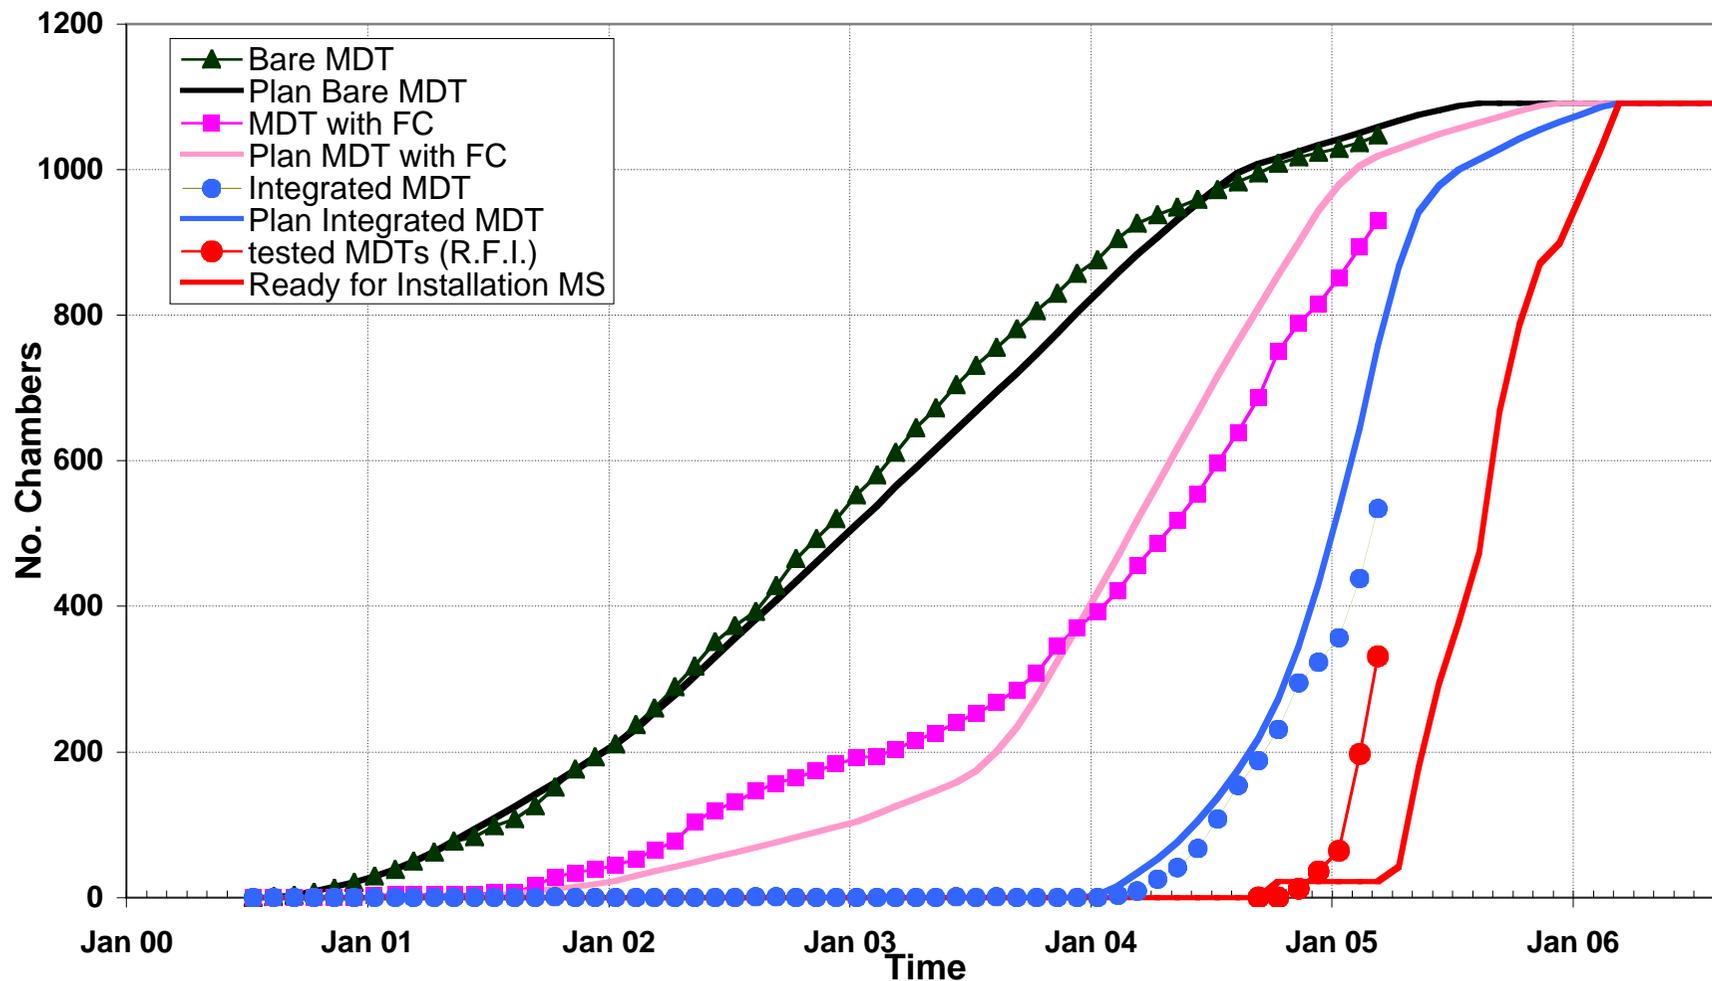

End-cap MDT chamber preparation for installation

Barrel muon chamber station with an MDT sandwiched between two RPC trigger chambers

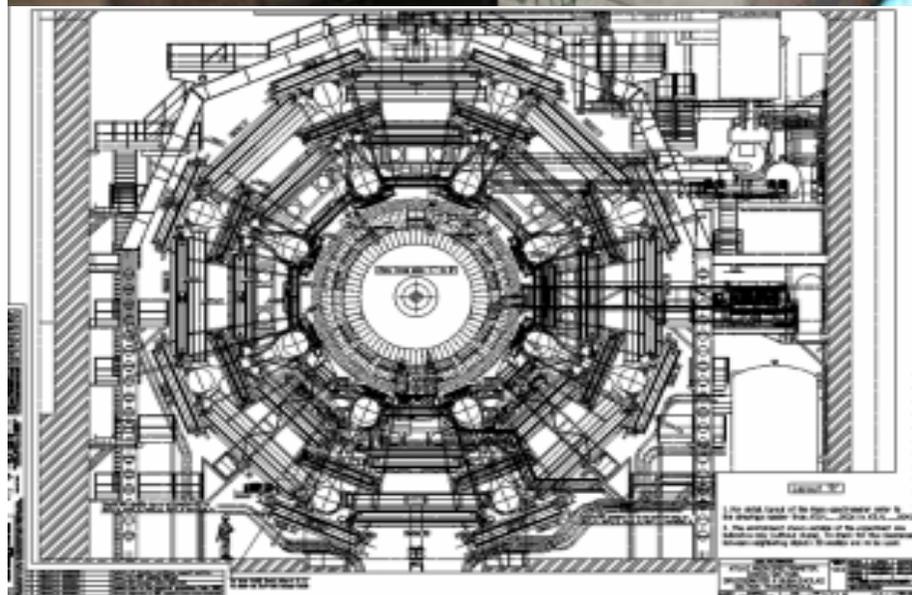

MDT Chamber Production (w/o EE)

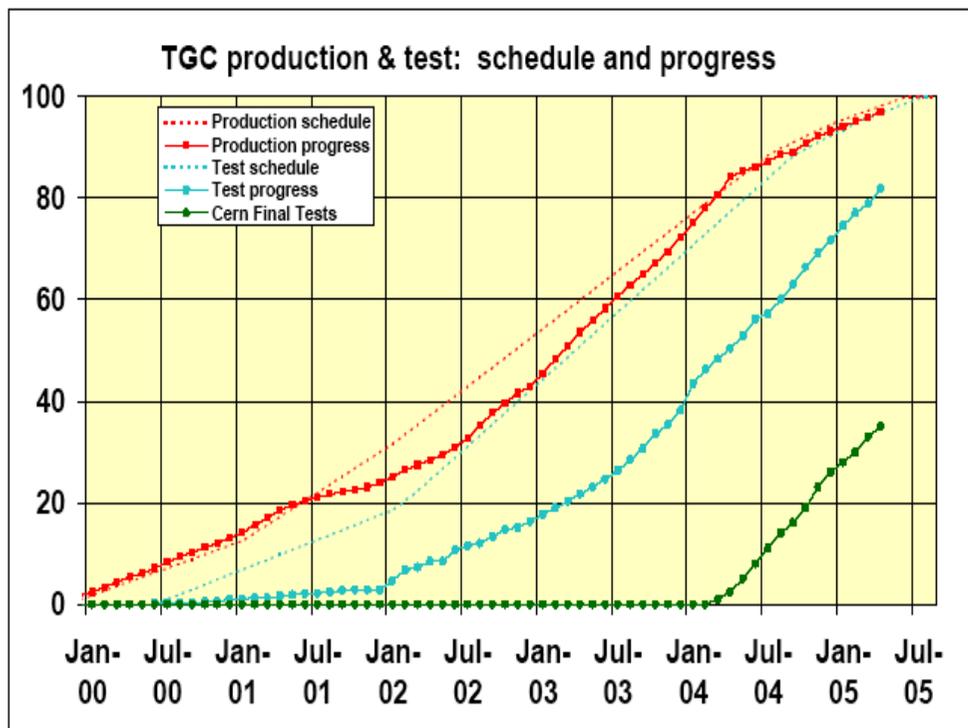

The installation of the barrel muon station has started in the feet region of the detector

Pre-assembly of the end-cap muon 'Big-Wheels'

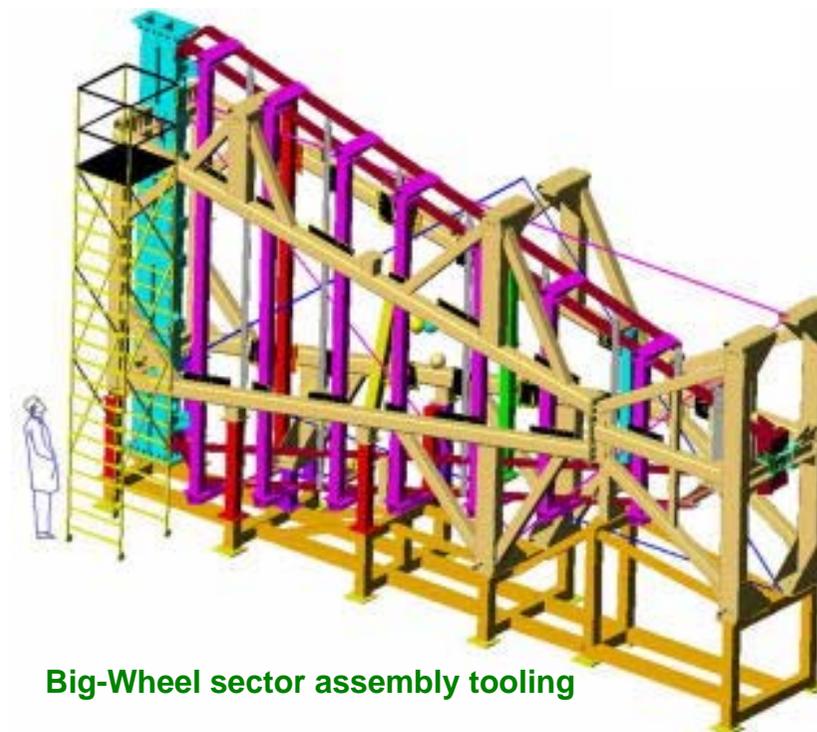

TGC end-cap trigger chamber production is nearing completion

Excellent work, on schedule, by the Japanese colleagues!

First MDT and TGC1 sectors and assembly tooling are now available at CERN

First TGC and MDT sectors are at CERN

Big-Wheel sector assembly tooling

The Japanese teams have completed well on schedule their large share of the TGC series construction, and they are now very busy with

- the integration at CERN preparing for the installation
- completion of the TGC trigger electronics

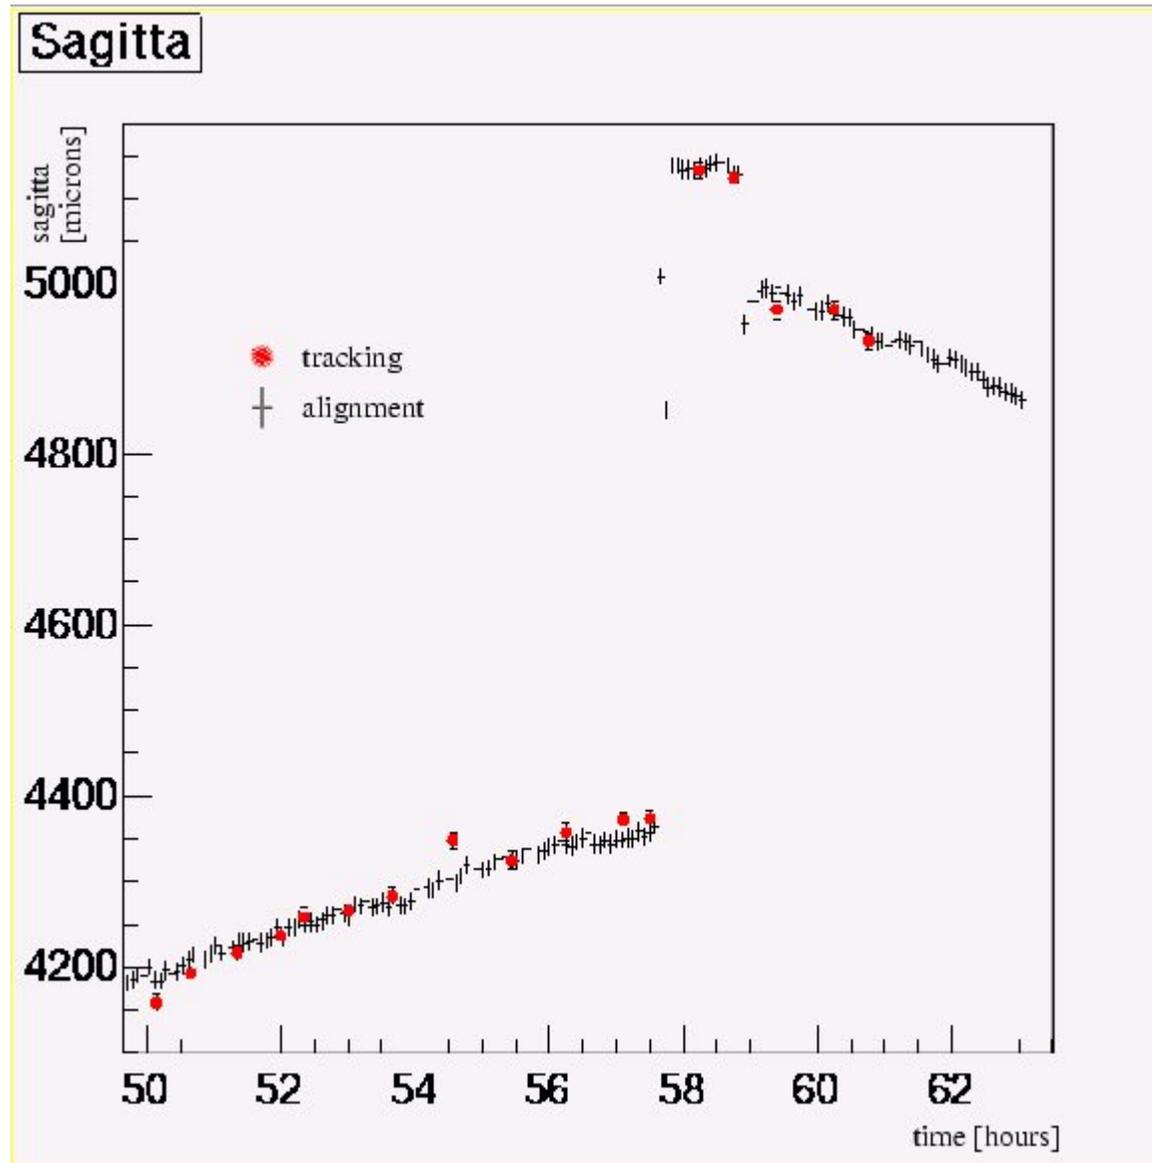

The large-scale system test facility for alignment, mechanical, and many other system aspects, with sample series chamber station in the SPS H8 beam

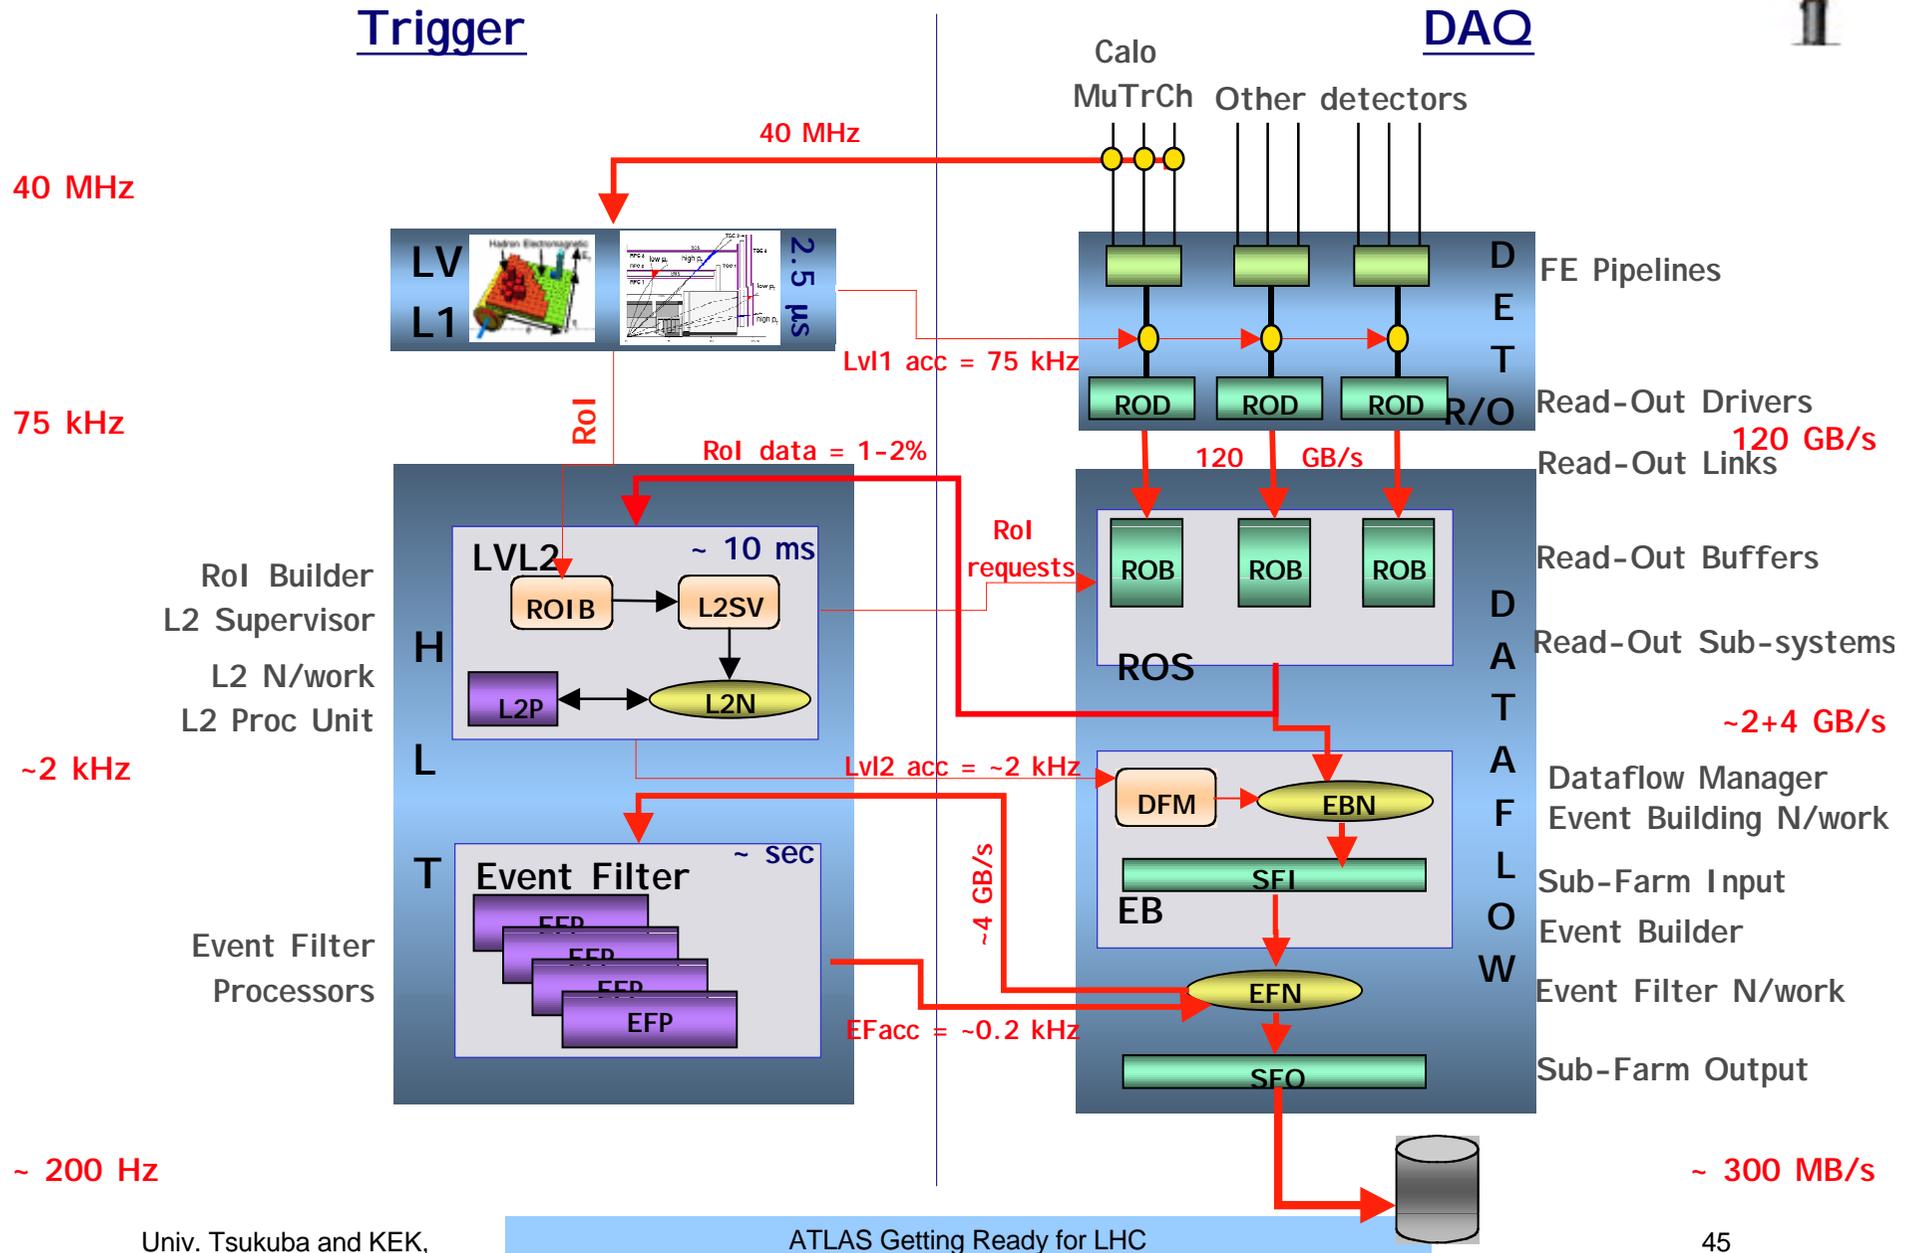

Shown in this picture is the end-cap set-up, it is preceded in the beam line by a barrel sector

Example of tracking the sagitta measurements, following the day-night variation due to thermal variations of chamber and structures, and two forced displacements of the middle chamber

Level-1

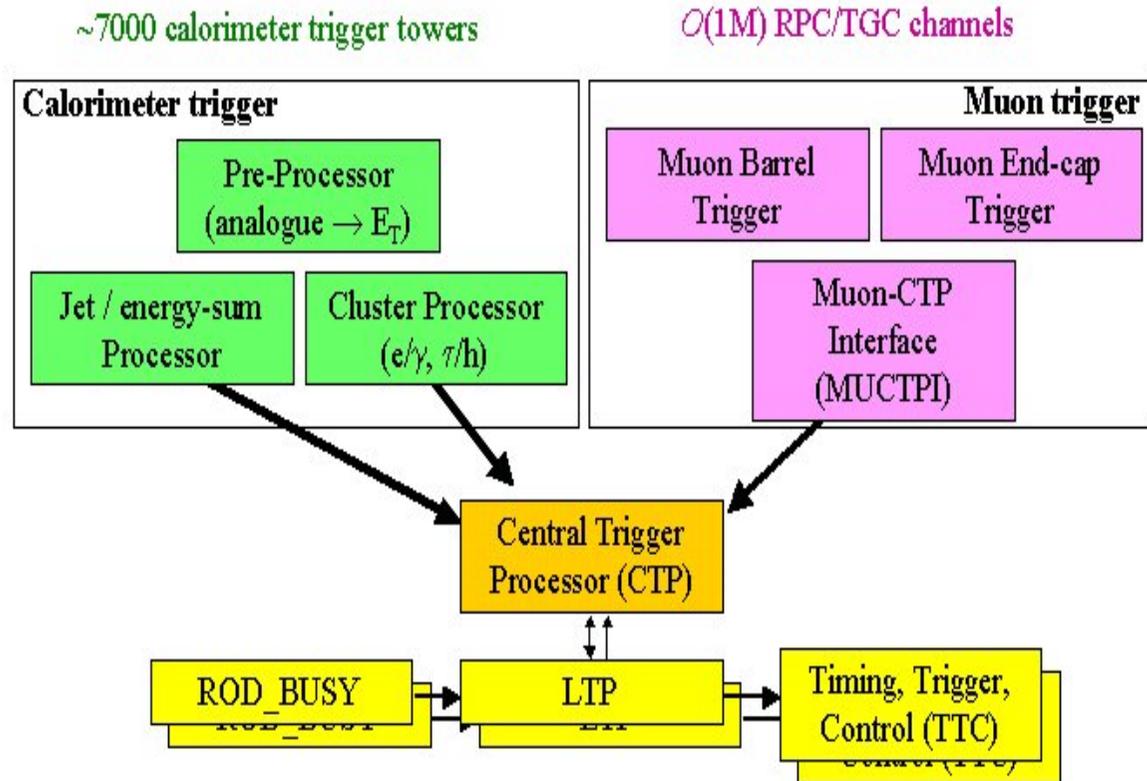

The level-1 system (calorimeter, muon and central trigger logics) completed the final ASICs developments and testing of full-functionality prototype modules; series production has started

The calorimeter level-1 trigger has worked successfully at the combined test beam in 2004

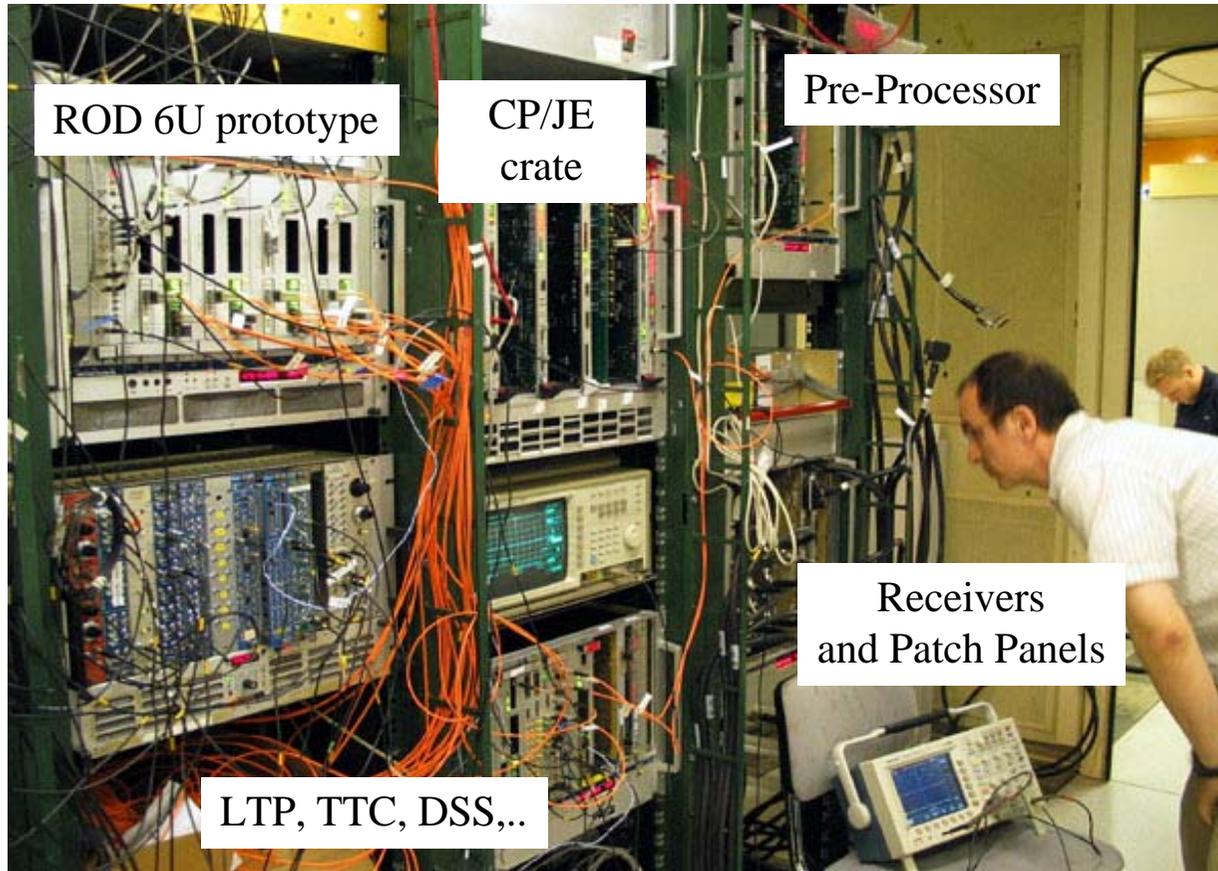

The muon level-1 trigger has been tested with 25 ns bunched test beams, final improvements were implemented in a last iteration

These final ASICs are now under tests, with very positive results, however

→ both the RPC and TGC ASICs are on the critical path (needed on-detector for integration)

The Central Trigger Processor progresses on schedule

Near-detector:
HPT and SSW

Muon Level-1 trigger at the combined test beam

HLT/DAQ/DCS

The HLT/DAQ/DCS work proceeded within the framework of the TDR approved early 2004

HLT/DAQ prototypes worked in the 2004 Combined Test Beam, as well as in test beds for optimizing the final design

A pre-series system is now being purchased and will be installed in Pit-1 (as a 10% data flow test)

Local DAQ capability is being set up at the Pit-1 for initial detector commissioning, using The Read Out Driver (ROD) crate DAQ

It is recalled that an important criteria in the choice of the HLT/DAQ architecture was the ability to scale the system for staging needs during the initial running of ATLAS

Components of the DCS are in fabrication, and are already widely used, and the DCS is one of the first systems brought into operation at Pit-1

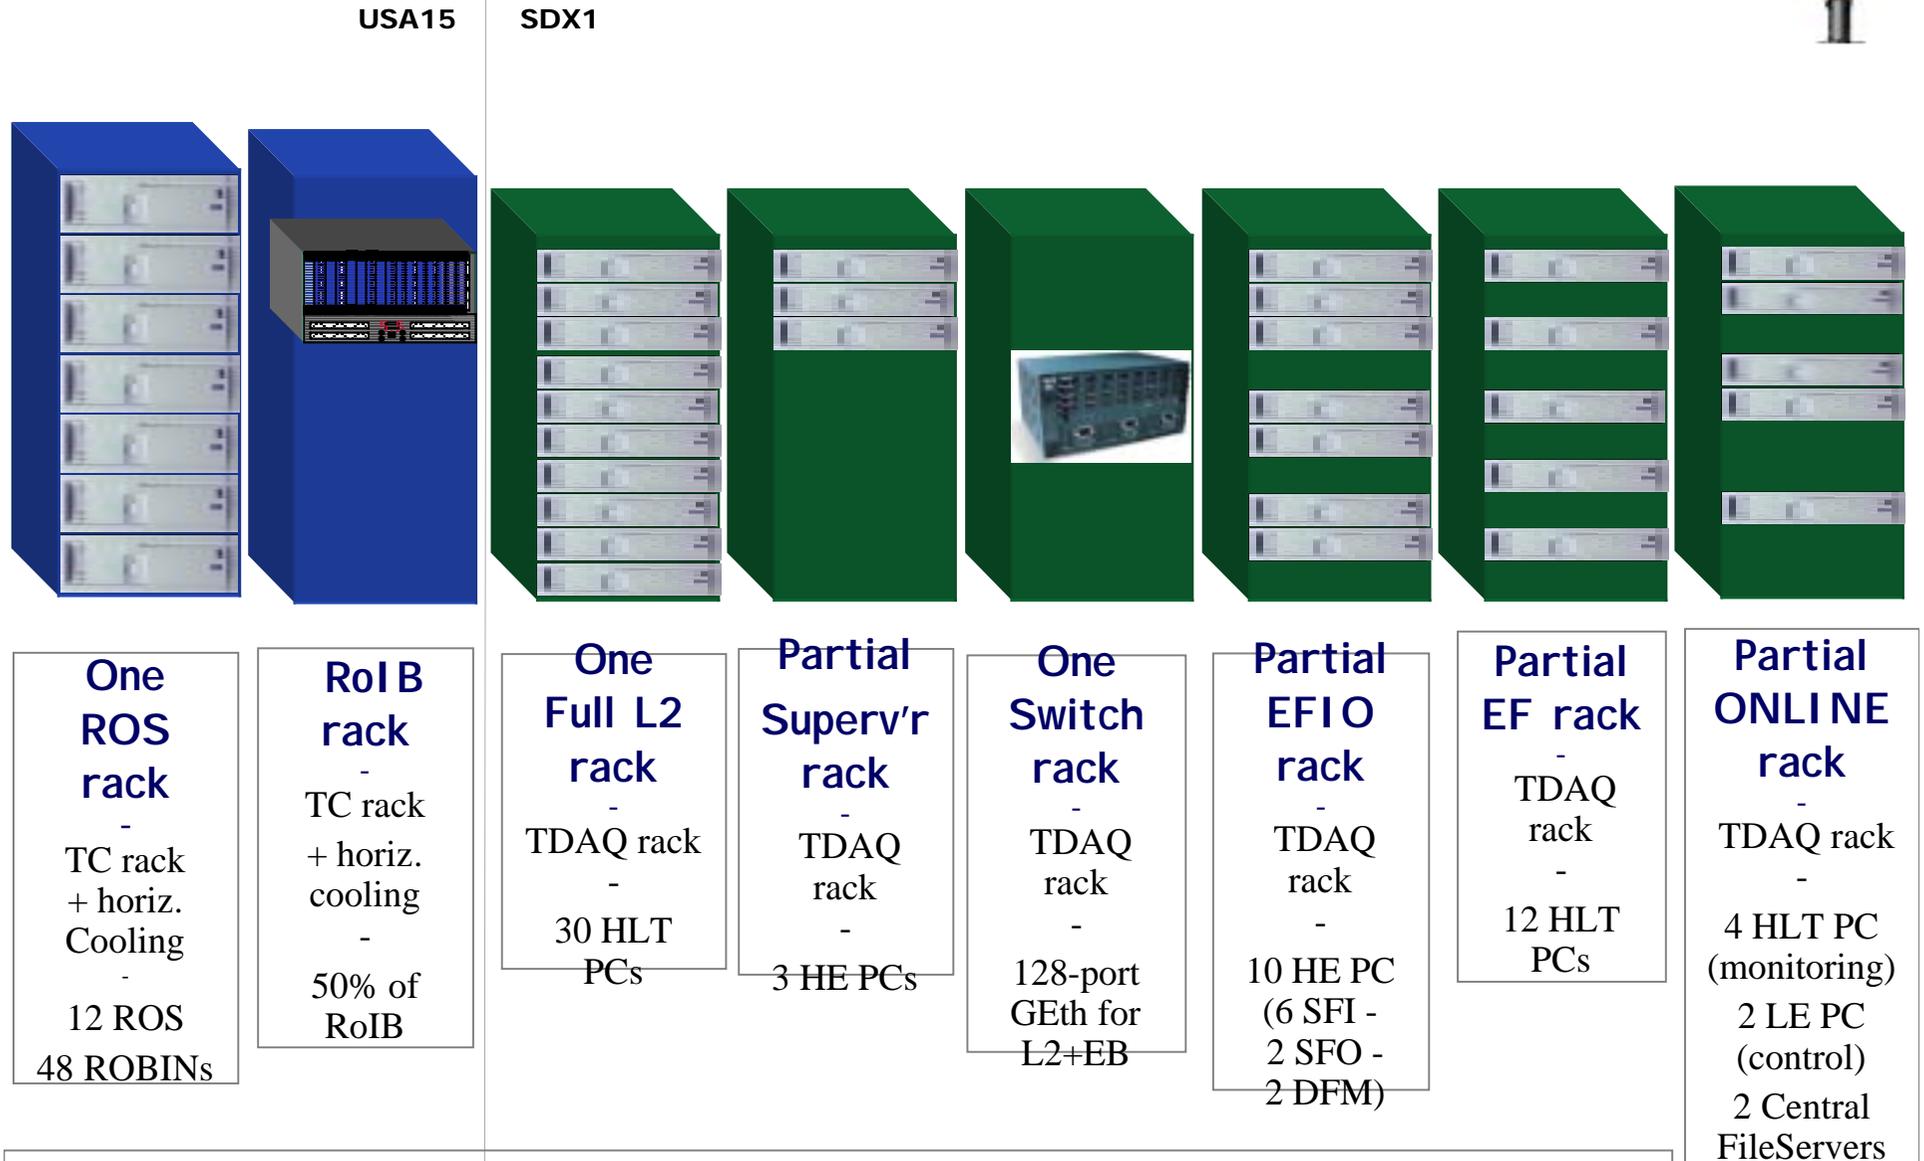

Final ROBIN module from pre-series

SDX1 HLT/DAQ room at the Pit-1 surface

Pre-series "Module-0" of final system: 8 racks at Pit-1 (10% of final dataflow)

ROS, L2, EFIO and EF racks: one Local File Server, one or more Local Switches

ATLAS Computing Timeline

Computing System Commissioning Goals

- We have recently defined the high-level goals of the Computing System Commissioning operation during the first half of 2006
 - Formerly called “DC3”
 - More a running-in of continuous operation than a stand-alone challenge
- Main aim of Computing System Commissioning will be to test the software and computing infrastructure that we will need at the beginning of 2007:
 - Calibration and alignment procedures and conditions DB
 - Full trigger chain
 - Tier-0 reconstruction and data distribution
 - Distributed access to the data for analysis
- At the end (mid-2006) we will have a working and operational system, ready to take data with cosmic rays at increasing rates

ATLAS DC2 production

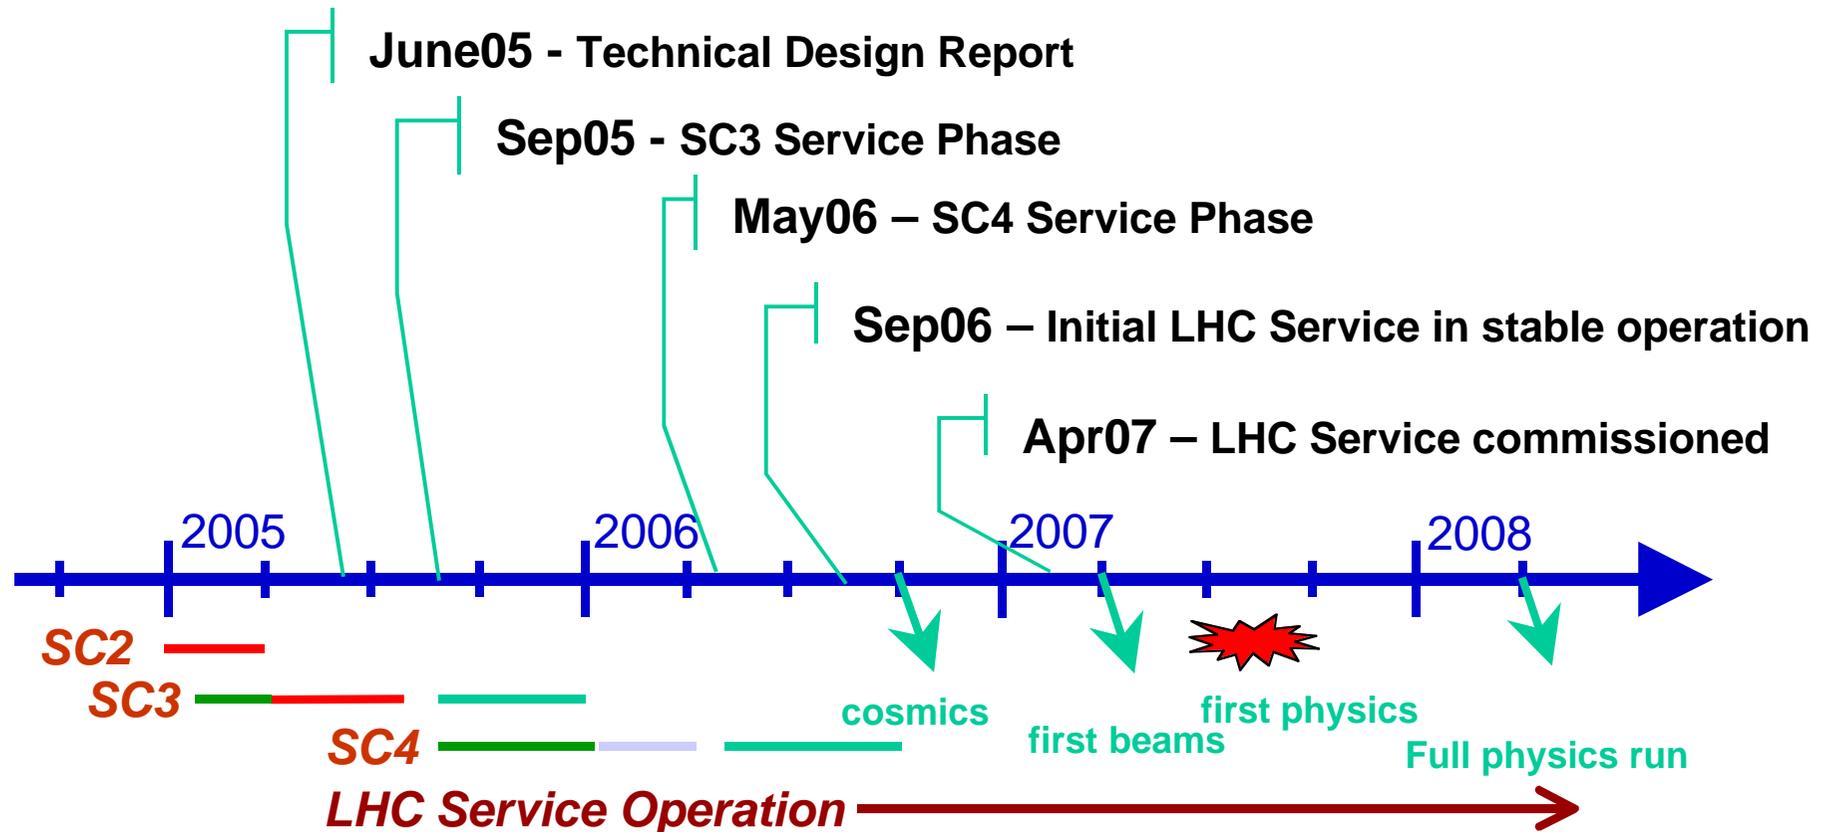

ATLAS Production - Number of Jobs - 30 November

LCG Computing Resources: May 2005

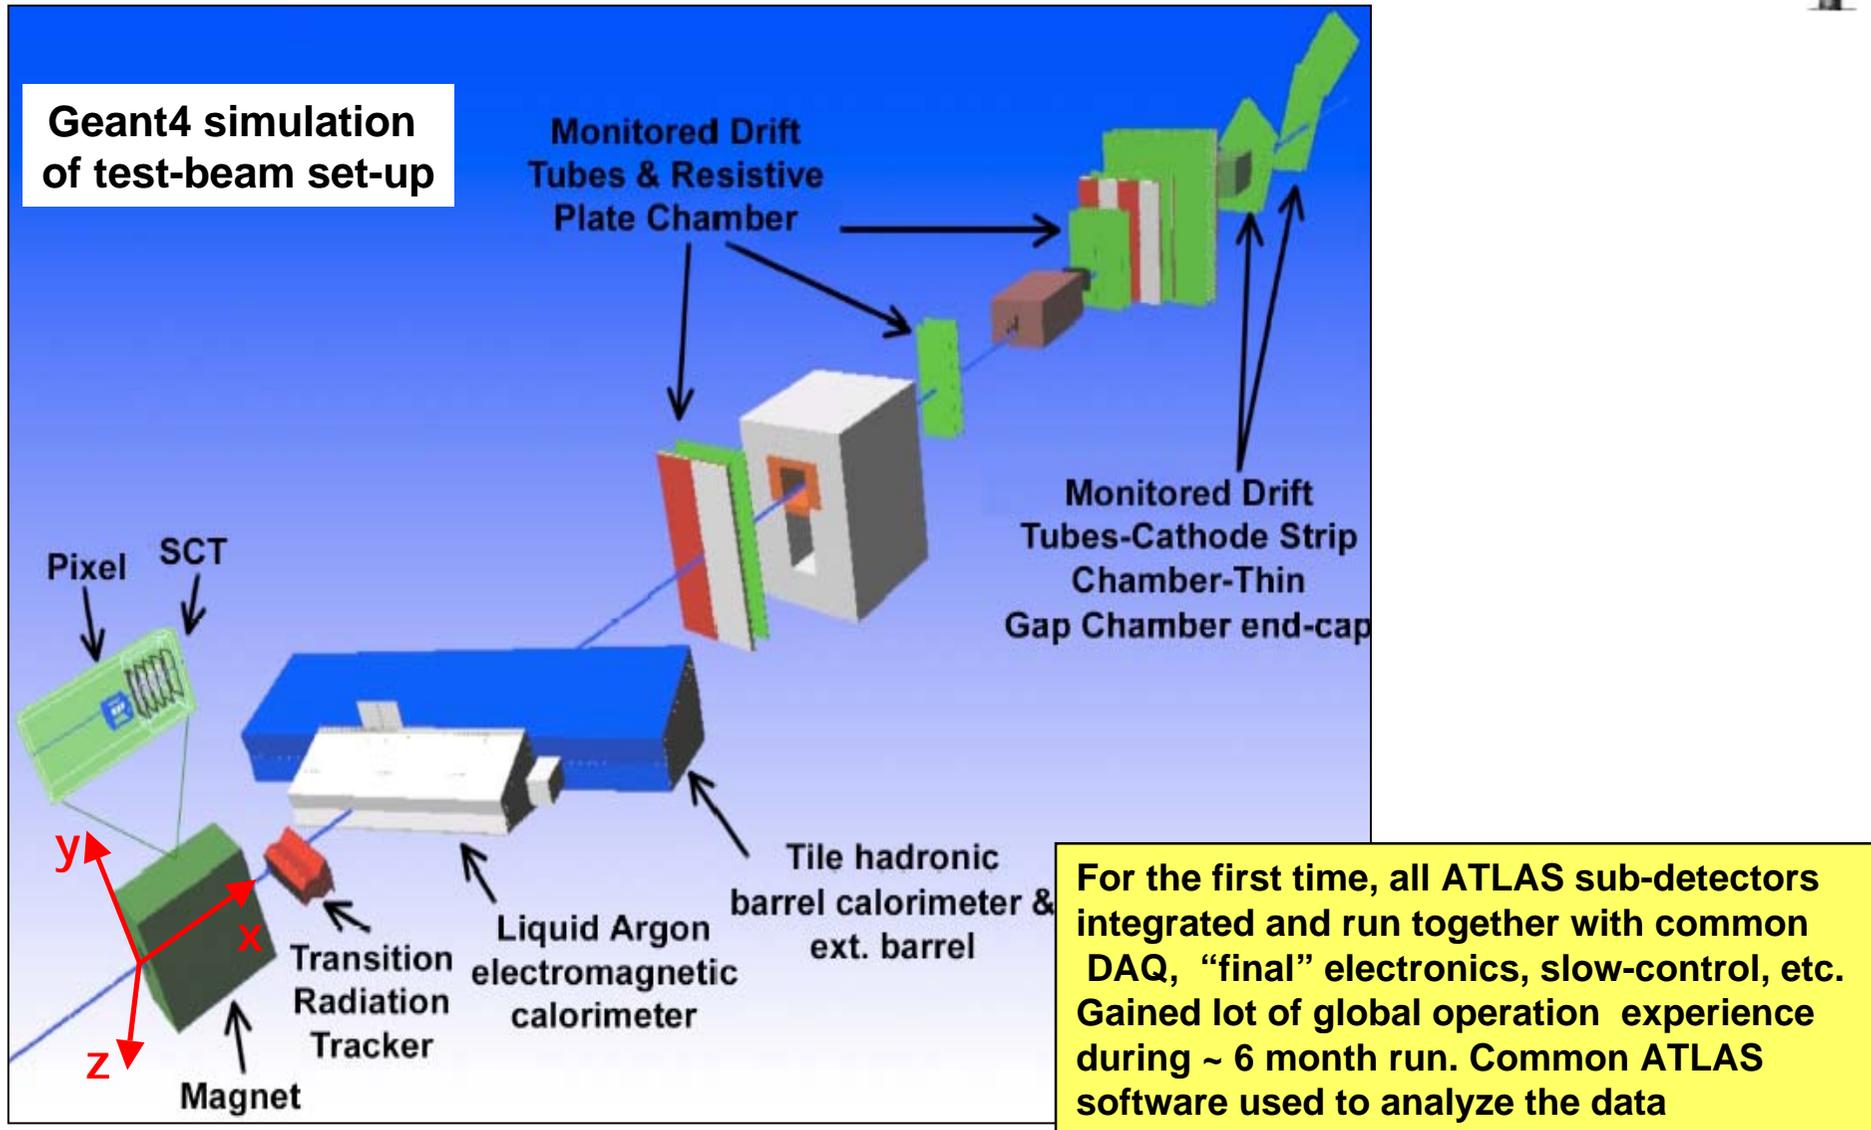

Service Challenges – ramp up to LHC start-up service

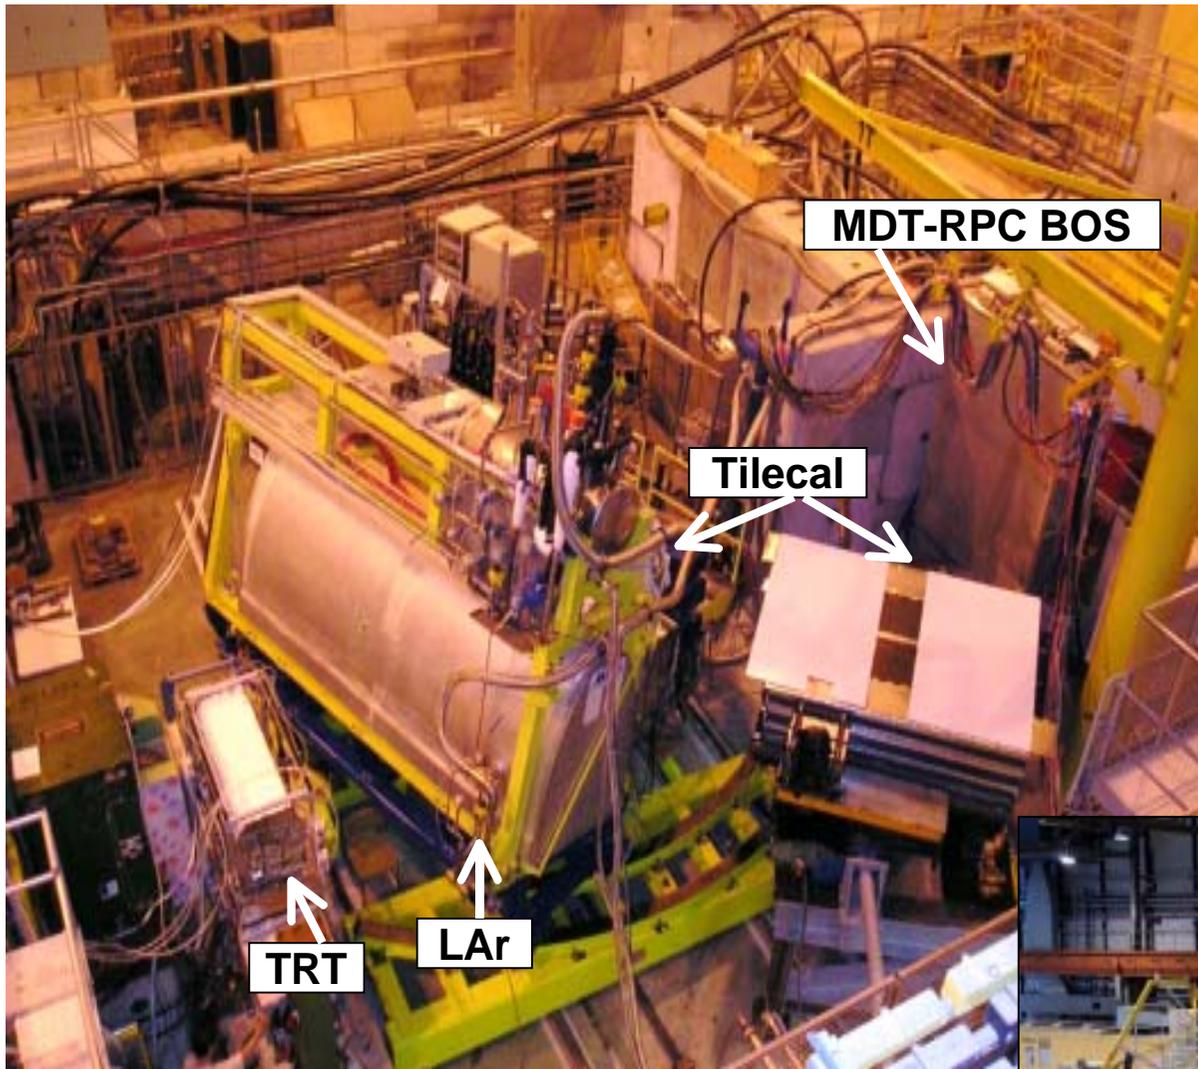

- SC2** – Reliable data transfer (disk-network-disk) – 5 Tier-1s, aggregate 500 MB/sec sustained at CERN
- SC3** – Reliable base service – most Tier-1s, some Tier-2s – basic experiment software chain – grid data throughput 500 MB/sec, including mass storage (~25% of the nominal final throughput for the proton period)
- SC4** – All Tier-1s, major Tier-2s – capable of supporting full experiment software chain inc. analysis – sustain nominal final grid data throughput
- LHC Service in Operation** – September 2006 – ramp up to full operational capacity by April 2007 – capable of handling twice the nominal data throughput

Towards the complete experiment: ATLAS combined test beam in 2004

Full “vertical slice” of ATLAS tested on CERN H8 beam line May-November 2004

~ 90 million events collected
~ 4.5 TB of data:

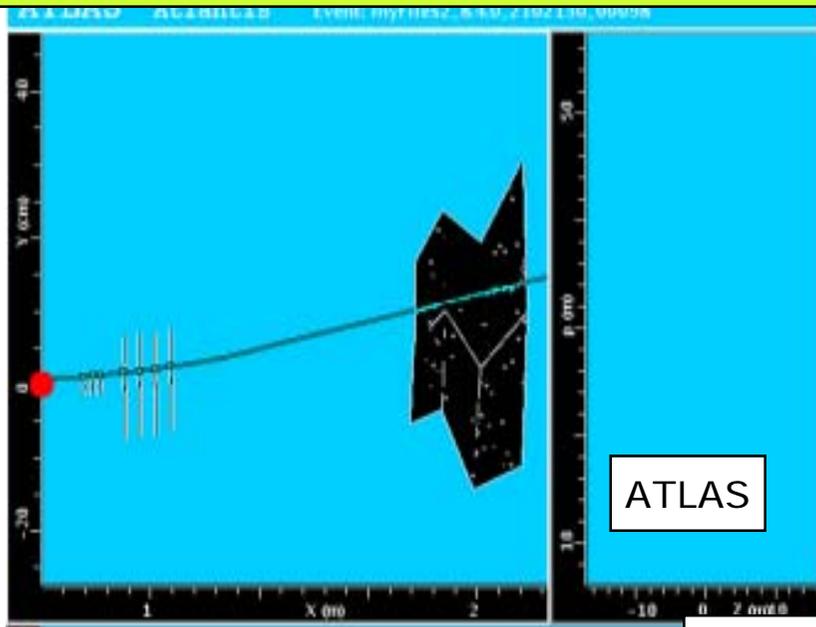

e^\pm, π^\pm	1 → 250 GeV
μ^\pm, π^\pm, p	up to 350 GeV
γ	~ 30 GeV

B-field = 0 → 1.4 T

Search for the Higgs boson

$$H \rightarrow ZZ^{(*)} \rightarrow 4\ell$$

Supersymmetric particles and dark matter

This particle (neutralino) is a good candidate for the universe dark matter

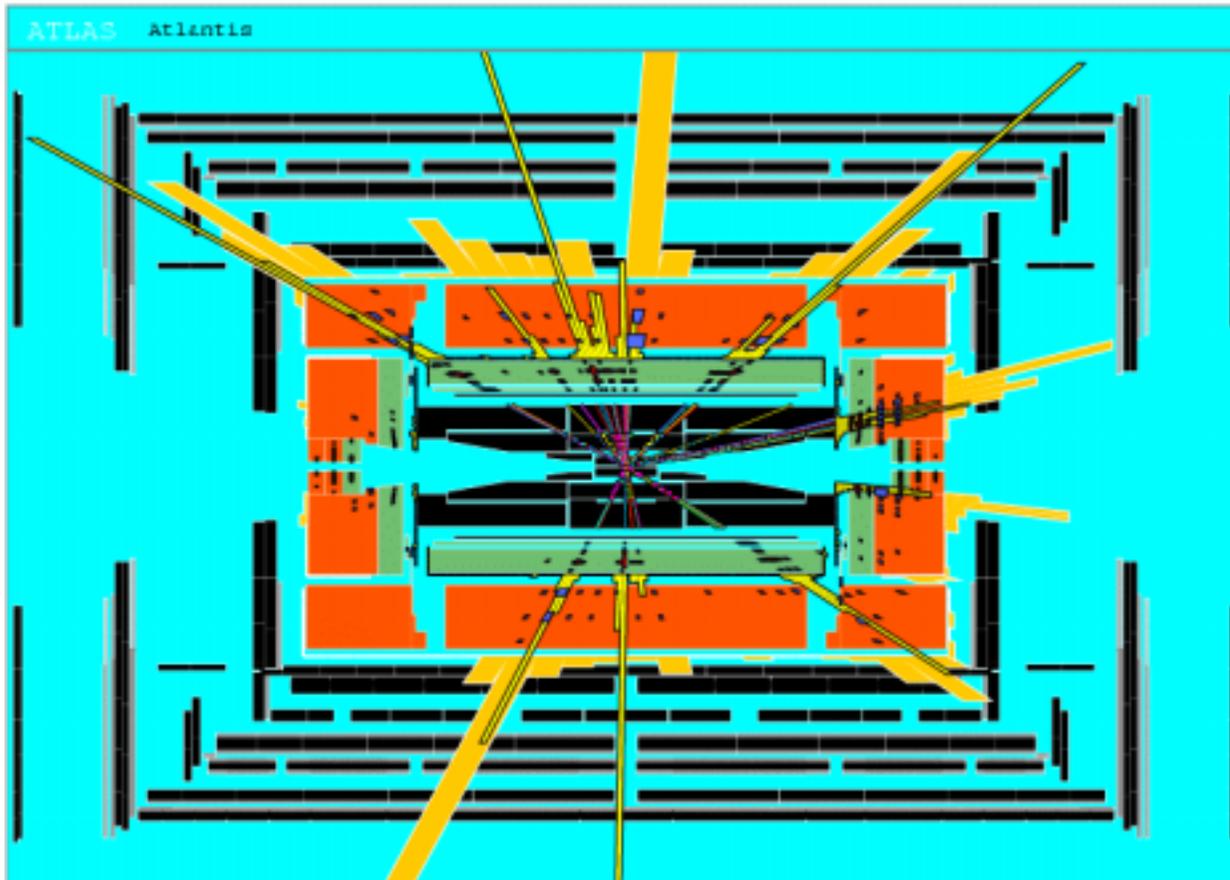

ATLAS discovery reach

Time	reach in squark/gluino mass
1 month	~ 1.3 TeV
1 year	~ 1.8 TeV
3 years	~ 2.5 TeV
ultimate	up to ~ 3 TeV

Strong impact of Japanese colleagues in the field of SUSY studies in ATLAS

Neutralino mass can be measured to 10% → SUSY discovery and neutralino mass measurement at LHC can solve problem of universe cold dark matter

If theories with **Extra-dimensions** are true, **mini black holes** should be abundantly produced and observed at the LHC.

Simulation of a black hole event with $M_{BH} \sim 8 \text{ TeV}$ in ATLAS

They decay immediately
→ harmless

Also in this field there is a great activity in Japan for the ATLAS physics

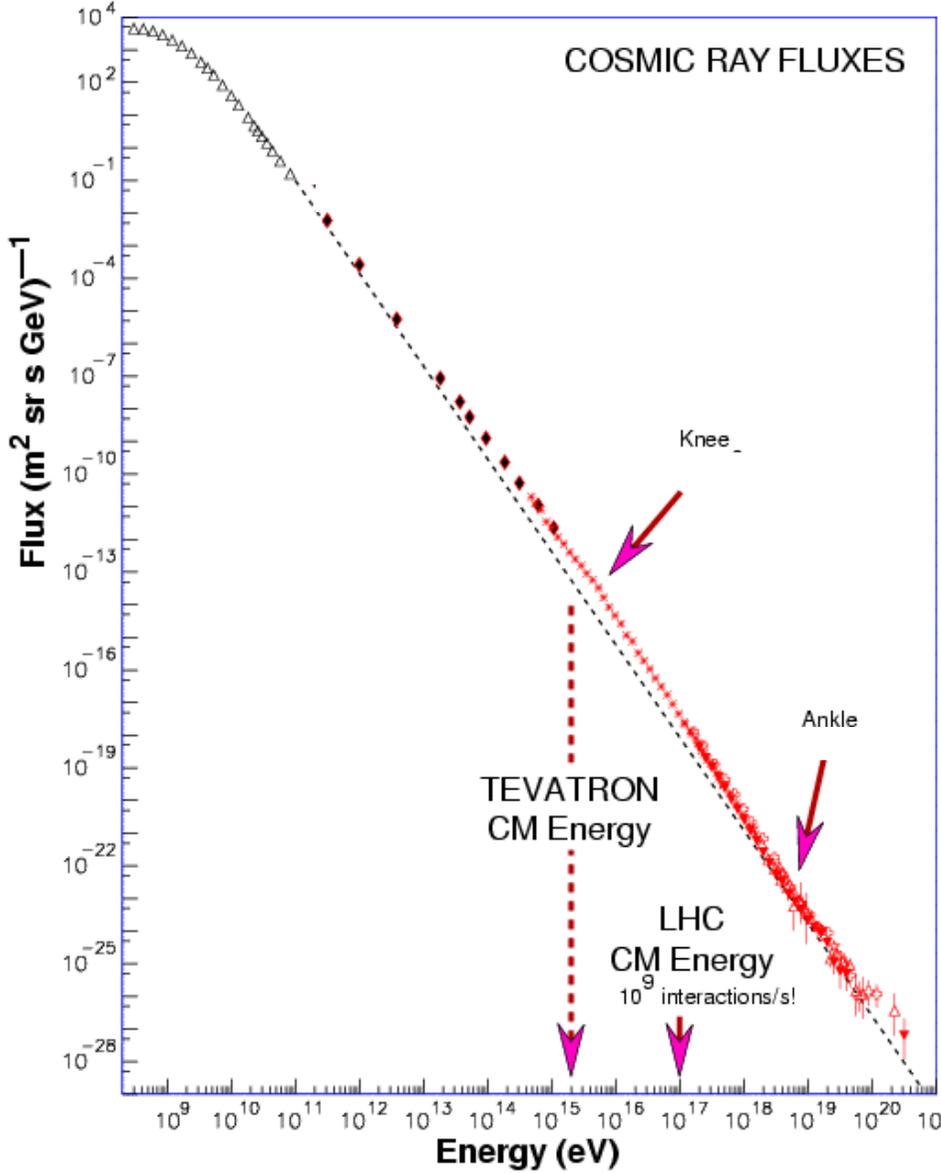

Are there links with astrophysics and cosmology ? Yes, many

$\sqrt{s} = 14 \text{ TeV}$

corresponds to $E \sim 100 \text{ PeV}$ fixed target proton beam

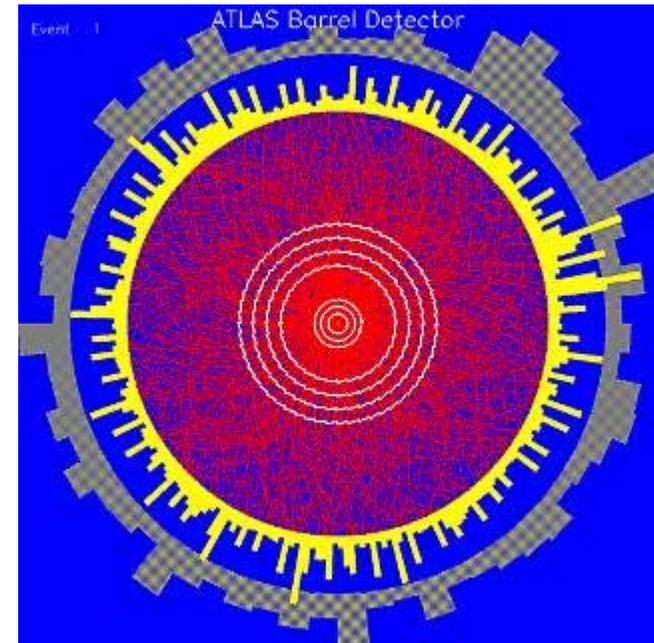

The LHC will be the first machine able to explore the high-E part of the cosmic ray spectrum

Ready for LHC

ATLAS potential for heavy ions

Specific strengths of the detector can be exploited for HI

- Best jet calorimetry at LHC → detailed jet quenching
- Tracking and muon spectrometer → production/suppression of heavy quark states

Back to virtual reality: planned status for August 2005 ...

Conclusions

The CERN Management and the LHC machine project team are most strongly committed to deliver first collisions in Summer 2007, thereby opening a new chapter in particle physics which will be exploited in a truly world-wide collaborative effort

Many important milestones have been passed in the construction, pre-assembly, integration and installation of the ATLAS detector components

Very major software and computing activities are underway as well, using the LHC Computing Grid for world-wide distributed computing resources

Planning for the commissioning and the early physics phases has started

The ATLAS Collaboration is highly motivated, and on track, for LHC physics in 2007

Japanese teams are making outstanding contributions to the project:

- Solenoid***
- SCT (silicon precision tracker in the Inner Detector)***
- TGC (muon trigger chambers in the end-caps)***
- Muon trigger in the end-caps***
- Software and computing***
- Physics studies (Higgs and SUSY, among others)***

The collaboration with the Japanese teams is excellent and very efficient, in short: a great pleasure!
